(Continued)

1. Each entry in column 1 represents the total dollar change in output that occurs in all industries within the state for each additional dollar of output delivered to final demand by the selected industry.

2. Each entry in column 2 represents the total dollar change in earnings of households employed by all industries within the state for each additional dollar of output delivered to final demand by the selected industry.

3. Each entry in column 3 represents the total change in number of jobs that occurs in all industries within the state for each additional million dollars of output delivered to final demand by the selected industry. Because the employment multipliers are based on regional data, the output delivered to final demand should be in regional year dollars.

4. Each entry in column 4 represents the total dollar change in value added that occurs in all industries within the state for each additional dollar of output delivered to final demand by the selected industry.

5. Each entry in column 5 represents the total dollar change in earnings of households employed by all industries within the state for each additional dollar of earnings paid directly to households employed by the selected industry.

6. Each entry in column 6 represents the total change in number of jobs in all industries within the state for each additional job in the selected industry.

NOTE.--Multipliers are based on the 2017 Benchmark Input-Output Table for the Nation and 2022 regional data.
