## the BUSINESS SITUATION

R

$\mathrm{R}_{\mathrm{t}}$EAL GNP increased at an annual rate of $71 / 2$ percent in the second quarter, following a 10-percent increase in the first, according to revised estimates presented later in this issue (table 1). ${ }^{1}$ Increases of this size are unusual six and seven quarters after a trough in GNP.

Labor markets, productivity, costs, and prices also registered favorable second-quarter developments. Civilian employment, as measured by the household survey, increased 1.4 million and unemployment declined 0.4 million. The civilian unemployment rate declined 0.4 percentage point, to 7.5 percent (chart 2 ). The unemployment rate for men dropped to 6.6 percent, below the rate for women (by 0.1 percentage point) for the first time since the fourth quarter of 1982. The unemployment rate for teenagers declined 0.9 percentage point in the second quarter to 18.7 percent.

[^1]Productivity-as measured by real gross product per hour in the nonfarm business economy less housingcontinued to improve, which is typical in recovery/expansion periods. Both the first- and second-quarter increases were $31 / 2$ percent (see table 1 on page 101). Unit labor cost, which was flat after a 3 -percent increase in the first quarter, continued to contribute sub-
stantially to sustaining a low rate of inflation in final product prices.

Prices as measured by the GNP fixed-weighted price index increased $3^{1 / 2}$ percent, down from 5 percent in the first quarter (table 2). The deceleration was more than accounted for by food prices. The price of GNP food components declined 2 percent, after a 12-percent increase in the first

[^2]quarter. The first-quarter increase had been largely due to freeze damage to fruits and vegetables and to higher meat prices; prices for these items have since declined. GNP energy prices were a partial offset; after a first-quarter decline of $21 / 2$ percent due to lower gasoline prices, energy prices increased 4 percent in the second quarter.

CHART 1
Real Product:
Change From Preceding Quarter

## Real GNP

The second-quarter deceleration in real GNP took the form of a large swing in inventory investment. Real business inventories were up $\$ 211 / 2$ billion, after increasing $\$ 311 / 2$ billion in the first quarter, and $\$ 7$ billion in the fourth (table 3). A major factor in the second-quarter decline in the rate of accumulation in inventories was a swing in motor vehicles from an increase of $\$ 7$ billion in the first quarter to a decline of $\$ 31 / 2$ billion in the second. Other nonfarm inventories, in contrast, were up even more in the second quarter than in the first.

A decline in the rate of accumula-
tion in farm inventories-from $\$ 51 / 2$ billion in the first quarter to $\$ 1$ billion in the second-was primarily due to the phasing out of the payment-inkind (PIK) program. Transfers of crops from the Commodity Credit Corporation (CCC) to farmers under PIK amounted to $\$ 8$ billion in the first quarter; in the second quarter, they were only $\$ 1 / 2$ billion. ${ }^{2}$
2. The handling of the payment-in-kind (PIK) program in the national income and product accounts (NIPA's) offsets these transfers (which relate to commodities produced in the past) in final sales; as a result, GNP, which is a measure of current production, is not affected. The PIK program and the NIPA procedure are described in "The U.S. National Income and Product Accounts: Revised Estimates," later in this issue.

1. Inasmuch as GNP is the sum of final products, the food and energy estimates in this table do not take into account the effect on the prices of final products of changes in the prices of the food and energy that are costs of production. purchases of food by the Federal Government other than transactions by the Commodity Credit Corporation that are treated like purchases of
purchases.
2. Consists of all components for which separate estimates are prepared. The major components that are not included are (1) exports of energy; (2) the gasoline and motor oil portions of inventories of gasoline service stations; and (3) the energy portions of inventories of businesses that do not produce energy for sale.

Note.-Most index number levels are found in the National Income and Product Accounts Tables, table 7.2.

[^3]

Real final sales jumped $101 / 2$ percent, following a $31 / 2$-percent increase in the first quarter. About 3 percentage points of the acceleration was due to CCC inventory transactions in government purchases. CCC inventory depletions are treated in the national income and product accounts (NIPA's) as negative Federal purchases. In the first quarter, CCC inventories had declined due to PIK transfers. This, in turn, had reduced Federal purchases. Other contributions to acceleration came from personal consumption expenditures (PCE), which increased even more strongly than in the first quarter, and net exports, which declined much less. Nonresidential fixed investment was up strongly in both quarters; residential investment increased less than in the first quarter. Developments in final sales components are discussed in the following sections.

## Personal consumption expenditures

Real PCE increased 7 percent, following an increase of $41 / 2$ percent in the first quarter. The acceleration was in nondurable goods and in services. Gains in real income and employment continued to spur consumer spending. Also, consumer confidence remained at high levels, despite some fluctuation.

Expenditures for durable goods increased $91 / 2$ percent, substantially less
than in the first quarter. The slowdown was evident in all of the major components. Increases in expenditures for motor vehicles had been very strong in the two preceding quarters.

Expenditures for nondurable goods increased $91 / 2$ percent, a much larger gain than in the first quarter. The acceleration was accounted for by large increases in expenditures for food and for clothing and shoes.
Expenditures for services were up 4 percent more than in the first quarter. Transportation was up more than in the first quarter. Electricity and natural gas increased, after two quarters of decline. Increases in most other components of services were either the same as, or larger than, in the first quarter.

## Fixed investment

Real residential investment increased $91 / 2$ percent in the second quarter, following a 21 -percent increase in the first. The deceleration was mainly attributable to singlefamily construction, which slowed from a 30 -percent rate of increase to a 13-percent rate.

The deceleration in single-family construction mirrored housing starts (chart 3). Single-family starts surged in January-February to 1.4 million (annual rate)-a surge many attribute
to unusually favorable weather condi-tions-before dropping to a MarchJune average of 1.1 million.

Mortgage commitment rates increased almost a full percentage point in the second quarter, to 14.5 percent at the end of June, and further increases are widely expected (chart 4). The runup in rates, along with increased house prices, appears to have put a damper on house sales. Sales of existing single-family homes decelerated in April and fell in May. Sales of new one-family houses fell in 4 of the first 5 months of the year. The greater weakness in sales of new houses is attributable, in part, to larger price increases. During the first 5 months of the year, the median sales price of new houses increased more than twice as fast as that of existing houses.

Real nonresidential fixed investment increased $201 / 2$ percent in the second quarter, the same rate as in the first. A slight deceleration in producers' durable equipment (PDE) offset an acceleration in structures. Motor vehicles-which are about onefifth of PDE-accounted for more than two-fifths of the second-quarter increase. Computers and photographic equipment accounted for about onehalf of the remaining increase. In structures, about three-fourths of the second-quarter increase was in commercial buildings. Industrial buildings registered its second straight increase following a prolonged decline.

U.S. Department of Commerce, Bureau of Economic Analysis

Selected Interest Rates

Real net exports declined $\$ 10$ billion, following an $\$ 81 / 2$ billion decline in the first quarter. Exports increased $\$ 4$ billion in both quarters. The firstquarter increase had been concentrated in goods, mainly agricultural products, automotive products to Canada, and capital goods. The second-quarter increase was largely in receipts of portfolio investment income.

Imports were up $\$ 51 / 2$ billion, following a $\$ 14$ billion jump in the first quarter. A large first-quarter increase in merchandise imports had been spread across most major end-use categories; merchandise imports increased much less in the second quarter. Payments for services picked up after no change in the first quarter.

## Government purchases

Real government purchases were up strongly, following a slight increase in the first quarter. The pickup was largely in Federal nondefense purchases which were greatly affected during the past several quarters by CCC operations, primarily under the PIK program. (As mentioned earlier, CCC inventory depletions are treated as negative Federal purchases.) Reductions in CCC inventories amounted to $\$ 9$ billion in the first quarter; in the second quarter, CCC inventories were unchanged, as PIK was phased out. Federal defense purchases increased $\$ 21 / 2$ billion, mostly in military hardware, following a small increase in the first quarter. State and local government purchases increased $\$ 11 / 2$ billion in both quarters; construction accounted for about one-half of the increases.

The Federal sector.-Changes in current-dollar Federal receipts and expenditures on a NIPA basis are shown in table 4 . Among expenditures, purchases were up $\$ 32$ billion; the huge increase was largely due to the CCC operations. Defense purchases also were up strongly in the second quarter. Transfer payments were up $\$ 2$ billion, as the decline in unemployment insurance benefits tapered and other transfers to persons continued to increase. Net interest
paid continued to increase, mainly reflecting higher interest rates on the Federal debt. An $\$ 18$ billion drop in sudsidies less the current surplus of Government enterprises was accounted for by a reduction in subsidies paid to farmers, as the PIK program was phased out. (The PIK subsidy payments offset CCC inventory changes
due to PIK, so these transactions have no effect on total Federal expenditures.) These changes and smaller changes in other components sum to an increase of $\$ 191 / 2$ billion in total expenditures in the second quarter.

Among receipts, an increase of $\$ 6$ billion in personal tax and nontax payments was largely due to contin-

ued growth in the tax base. Indirect business taxes were up $\$ 1$ billion, and contributions for social insurance were up $\$ 4$ billion. Estimates of corporate profits, and thus of corporate profits tax accruals, are not yet available. If, as is likely, profits and profits tax accruals changed little, then total receipts would register an increase about one-fourth as large as that in the first quarter.

An increase of this size in receipts would be less than one-half of the increase in expenditures, so the deficit on a NIPA basis would increase about $\$ 10$ to $\$ 15$ billion from the $\$ 161 \frac{1}{2}$ billion registered in the first quarter.

## Personal Income

Personal income increased $\$ 641 / 2$ billion in the second quarter, following an $\$ 84$ billion increase in the first (table 5). The deceleration can be almost entirely attributed to the sharp drop in Federal subsidy payments to farmers.

Wage and salary disbursements registered another strong increase in the second quarter. Wages and salaries in manufacturing and in other commodi-ty-producing industries were up less than in the first quarter, but those in the distributive and in the service industries were up more. Government wages and salaries increased $\$ 3$ billion less than in the first quarter; the difference was due to a pay raise for Federal civilian and military employees in the first quarter.

Farm proprietors' income dropped in the second quarter after a strong increase. Payments to farmers under PIK amounted to only $\$ 11 / 2$ billion; they had been $\$ 19$ billion in the first quarter. A slowdown in the increase in nonfarm proprietors' income was in retail trade and, to a lesser extent, in construction.

Among the other components of personal income, personal interest income registered another substantial increase in the second quarter. Transfer payments were up somewhat more than in the first quarter, as the decline in unemployment insurance benefits tapered. Personal contributions for social insurance, which are
subtracted in deriving the personal income total, increased less than in the first quarter, when they had been boosted by several legislated changes in social security.

Reflecting the continued growth in the taxable wage base, personal tax and nontax payments were up $\$ 9$ billion in the second quarter after a
$\$ 101 / 2$ billion increase in the first. The increase in disposable personal income-personal income less taxesdecelerated to $\$ 551 / 2$ billion, or 9 percent, from $\$ 731 / 2$ billion, or $121 / 2$ percent, in the first quarter. Due to a slowing down in PCE prices, real income did not decelerate as much. Real disposable personal income in-
creased 7 percent in the second quarter, following an 8 -percent increase in the first.
Personal outlays increased about as much as disposable income in the second quarter, so personal saving changed little. The personal saving rate edged down 0.1 percentage point to 6.0 percent.

# The U.S. National Income and Product Accounts: 

Revised Estimates<br>- 1981-83<br>- First and Second Quarter 1984

STIMATES of the national income and product accounts (NIPA's) for the

last 3 years have been revised. As is usually done in July, new source data have been incorporated and seasonal factors have been updated.

The revised estimates for the period including the first quarter of 1981 through the second quarter of 1984 are shown following this article. (The box below describes the other forms in which the revised estimates are available.) Estimates for 1980 can be found in the July 1983 Survey of Current Business, for 1977-79, in the July 1982 Survey, and for earlier years, in The National Income and Product Accounts of the United States, 1929-76: Statistical Tables. ${ }^{1}$

In the new estimates-

- The cyclical fluctuations during the period are similar to those in the previously published estimates, although in the new estimates the expansion in real GNP in 1981 is interrupted in the second quarter and the trough in 1982 is in the third quarter rather than the fourth (chart 5).
- The course of productivity change, largely mirroring the cyclical fluctuations, is also similar.

1. Errata for selected series are shown in the July 1982 Survey, in the August 1982 Survey, in the July 1983 Survey, and on page 17 of this issue.

The revised estimates are available for sale in machine readable form. For further information, write to the National Income and Wealth Division (BE-54), Bureau of Economic Analysis, U.S. Department of Commerce, Washington, D.C. 20230, or call 202-523-0669.

Alternative estimates of capital consumption and profits of nonfinancial corporations and of the fixed capital stock are available from the same source and will be shown in a subsequent issue of the Survey.

- The pattern of slowing inflation in 1981 and 1982 is the same as in the previously published estimates. No revision in percent change from the preceding quarter in the GNP fixedweighted price index exceeded 0.4 percentage point and the level of the index $(1972=100)$ by the fourth quarter of 1983 was only 0.1 index point lower than in the previously published estimates (chart 6).
- The personal saving rate is higher, especially in the quarters of 1982, when it averaged about one-half a percentage point higher (chart 7).
- The Federal deficit on a NIPA basis differs little from that shown in the previously published estimates, except in the last two quarters of

1983, when it is somewhat lower. The State and local surplus (excluding social insurance funds) is substantially lower in 1983.

The first section of this article provides a summary of the revisions for 1981-83 in terms of annual estimates of current-dollar GNP, constant-dollar GNP and associated price indexes, charges against GNP, and sector and saving-investment transactions. The next section provides methodological notes on several aspects of the revisions.

## Summary of Revisions in Annual Estimates

Table 1 shows the most important new and revised source data for cur-rent-dollar GNP and charges against GNP. The years shown are the years of the estimates into which these data are directly incorporated.

## Current-dollar GNP

Current-dollar GNP was revised up $\$ 3.7$ billion in 1981 , down $\$ 3.7$ billion
in 1982, and down $\$ 5.7$ billion in 1983 (table 2). The revisions in the percent changes from the preceding year were up 0.2 and down 0.2 percentage points, respectively, in 1981 and 1982;

the percentage change was not revised in 1983. The personal consumption expenditures component (PCE) was revised down substantially in both 1981 and 1982 and each of the other final sales categories was revised up by a small amount. Thus, the contrasting direction of the revision in GNP in the 2 years was due to the change in business inventories, which was revised up sharply in 1981 and down by a small amount in 1982. In 1983, PCE was again revised down, but only $\$ 2.1$ billion. Government purchases and the change in business inventories were also revised down, the former $\$ 4.0$ billion and the latter $\$ 7.0$ billion. Fixed investment was revised up $\$ 6.7$ billion, mainly reflecting a large revision in producers' durable equipment, and net exports was revised up $\$ 0.7$ billion.

Revisions in PCE goods were downward, by small to moderate amounts each year. In durable goods, the revisions were negligible. In 1982 and 1983, small to moderate downward revisions in motor vehicles were offset by upward revisions in other durables. Nondurable goods were revised down each year, and included large downward revisions in food pur-

## ACKNOWLEDGMENTS

Gerald F. Donahoe, Chief of the National Income and Wealth Division, was responsible for planning and carrying through the annual NIPA revision, under the general direction of Robert P. Parker, Associate Director for National Economic Accounts. Richard C. Ziemer and Joseph C. Wakefield of the Government Division directed major parts of the work for this project. Norman E. Bakka developed the computer systems. Shelby W. Herman assisted in the review of the estimates.
Carol S. Carson and George Jaszi wrote the article describing the revisions.
BEA staff that made significant contributions to the revisions are listed below:
Personal consumption expenditures-JAMES C. BYRNES, Clinton P. McCully, Paul R. Lally, Renee M. Valliere, Moses J. Branch, Ellen B. Arroyo.
Investment-DAVID W. CARTWRIGHT. Fixed investmentJeffrey W. Crawford, Mary E. Joyce. Inventories-John Mon, Anthony D. Eckman, John M. Ryan, Mary K. Osinalde.
Net exports-LEO M. BERNSTEIN, Phyllistine M. Barnes.
Federal government transactions-DAVID T. DOBBS. Receipts and expenditures-Hermione A. Anglin, Deloris T. Tolson. Constantdollar estimates-KARL D. GALBRAITH, Robert T. Mangan.
State and local government transactions-DAVID J. LEVIN.

Receipts and expenditures-Richard D. Melchionno. Constantdollar estimates and computer services-Donald L. Peters.
Measures of price change-SHELBY W. HERMAN.
Personal income-MARTIN MURPHY. Wages and salariesPauline M. Cypert, Kathryn A. Comins. Other labor incomeMartin Murphy. Other contributors to the personal income estimates include: George M. Smith, Imogene C. Petersen, Mary V. Pitts, and Thae S. Park.
Business income-KENNETH A. PETRICK. Corporate profitsWillie J. Abney, Dorothy G. Collins, Jerry L. Stone. Nonfarm proprietors' income-Susan P. Den Herder.
Property income-MARY W. HOOK. Interest-Teresa L. Weadock. Rental income of persons-Teresita Chan.
Capital consumption allowances and adjustments-JOHN A. GORMAN, John C. Musgrave, Gerald Silverstein.
Industry product-MILO O. PETERSON, Sherlene K.S. Lum, Vesta Jones, Stephen P. Baldwin, M. Greg Key, Marilyn E. Baker.
Farm output and income-MARY W. HOOK, George Smith.
Table preparation, analysis, and review-JEANETTE M. HONSA, Phyllistine M. Barnes, M. Greg Key.
Secretarial-EUNICE V. BLUE, Dorothy A. Wilson, Esther M. Carter, Gail P. Jones.
chases. In services, the revisions were downward by moderate amounts in 1981 and 1982 and negligible in 1983. Medical care was revised down by moderate amounts each year. Several other components-including religious and welfare services, net foreign travel in 1982, and personal business services in 1983-were also revised down.

Revisions in nonresidential fixed investment were upward each year, by small amounts in 1981 and 1982 and $\$ 4.5$ billion in 1983 . In structures, the revisions were negligible in 1982 and small in 1981 and 1983. Public utilities were revised up each year; these revisions were offset by downward revisions in petroleum and natural gas mining and exploration and in farm
structures in 1982 and more than offset by downward revisions in these components in 1983. Producers' durable equipment was revised negligibly in 1981 and up in 1982 and 1983. The 1983 revision was concentrated in motor vehicles and also included upward revisions in computers. Residential investment was revised negligibly in 1981 and 1982. In 1983, more

Table 1.-Major New Source Data for Current-Dollar Estimates

## ${ }^{r}$ Revised.

PCE Personal consumption expenditures.
PDE Producers' durable equipment.
CBI Change in business inventories.
IVA Inventory valuation adjustment.
CCAdj Capital consumption adjustment.
Note.-Years shown are the years of the estimates into which the new source data are directly incorporated.
than one-half of a $\$ 2.2$ billion upward revision was accounted for by the additions and alterations component.

Revisions in the change in business inventories were up $\$ 7.6$ billion in 1981, down $\$ 1.6$ billion in 1982, and down $\$ 7.0$ billion in 1983 . The 1981 revision was in the change in the book value of inventories held by industries other than manufacturing and trade. The small 1982 revision was due to downward revisions in farm inventories and in the inventory valuation adjustment for nonfarm inventories. The large 1983 revision was mainly in farm inventories (see note 2). For nonfarm inventories, a small upward revision in the change in book values was offset by a downward revision in the inventory valuation adjustment.

For net exports, the revisions were small and upward each year. Exports were revised up each year, due to small upward revisions in the services components. Imports were revised down in 1981 and 1982 and negligibly in 1983; as in exports, the revisions were in services (see note 3 ).

Government purchases were revised up by small amounts in 1981 and 1982 and down $\$ 4.0$ billion in 1983. In State and local purchases, the total and most components were revised up each year. In Federal purchases, revisions were negligible in national defense purchases each year and in nondefense purchases in 1981 and 1982. In 1983, a $\$ 5.3$ billion downward revision was concentrated in purchases of the Commodity Credit Corporation (see note 2).

## Constant-dollar GNP and associated price indexes

In constant (1972) dollars, GNP was revised down each year- $\$ 1.7$ billion, $\$ 5.4$ billion, and $\$ 0.6$ billion in 1981, 1982 , and 1983 , respectively (table 2 ). The revisions in the percent changes from the preceding year were down 0.1 , down 0.2 , and up 0.3 percentage point, respectively.

The differences between the revisions in percent change in currentdollar GNP and in constant-dollar GNP, and also in the components,
appear as revisions in percent change in the implicit price deflators (table 3 ). The revisions in percent change in the implicit price deflators can be decomposed into two parts: one due to revisions in the composition of goods and services, and one due to revisions in prices. The former can be seen as the difference between revisions in percent change in implicit price deflators and in fixed-weighted price indexes; the latter can be seen as revisions in percent change in fixedweighted price indexes. In the fixedweighted price indexes, the revisions in percent change were generally small. Revisions of as much as 0.3 percentage point occurred in more than 1 year only in residential investment, imports, and Federal purchases.

## Charges against GNP

Revisions in total charges against GNP, as shown in table 4, were similar to those in GNP except in 1981. In that year, when GNP was revised up

Source: NIPA tables 1.1 and 1.2.
but charges against GNP was revised down, the revision in the statistical discrepancy was $\$ 10.6$ billion. In 1982 and 1983 , revisions in the statistical discrepancy were small.

Each year, the revision in charges against GNP reflected moderate to large downward revisions in components that were only partly offset by upward revisions, some of which were large. The largest revisions-not all
in the same direction-were in net interest and proprietors' income. Two components-compensation of employees and corporate profits-were revised down each year by small to moderate amounts. Revisions in other components were small.
Compensation of employees was revised down $\$ 3.8$ billion in 1981, $\$ 1.4$ billion in 1982 , and $\$ 5.3$ billion in 1983. In 1981, the revision was con-
centrated in other labor income; in 1982, in employer contributions for social insurance; and in 1983, in wages and salaries.
Proprietors' income, which was revised up in 1981 and 1982 by $\$ 5.0$ and $\$ 2.1$ billion, respectively, reflected small to moderate upward revisions in both the farm and nonfarm components. In 1983, when the revision was down $\$ 6.8$ billion, the farm income

Table 3.-Gross National Product, Implicit Price Deflators, and Fixed-Weighted Price Indexes

Source: NIPA table 8.1.
component was revised down $\$ 7.1$ billion.

Rental income of persons was revised up each year, by small amounts in 1981 and 1982 and by $\$ 3.5$ billion in 1983.

Corporate profits were revised down by a small amount in 1981, by $\$ 5.7$ billion in 1982, and by $\$ 4.0$ billion in 1983. Profits before tax-that is, book profits-were revised down even more. Domestic profits in most industries except public utilities were revised down. The inventory valuation adjustment was revised down by small amounts in 1982 and 1983, and the capital consumption adjustment was revised up by moderate amounts each year.

Net interest was revised down $\$ 8.9$ billion in 1981, negligibly in 1982, and up $\$ 9.1$ billion in 1983 (see note 4).

Revisions in capital consumption allowances with capital consumption adjustment, indirect business taxes, and subsidies less the current surplus of government enterprises were negligible with one exception. Indirect business taxes were revised down $\$ 5.5$ billion in 1983, largely due to State and local property taxes.

## Sector and saving-investment transactions

The current-dollar revisions discussed so far are for GNP, charges
against GNP, and their components, which make up the two sides of the national income and product account in the NIPA five-account summary system (see table A on page 18). This summary system also includes three sector accounts-for persons, for government, and for foreigners in their transactions with the United Statesand a gross saving and investment account. Many of the transactions in these accounts are the counterentries to transactions for which the revisions have already been mentioned. The following references are limited to revisions in other transactions and aggregates.

In the personal income and outlay account, personal income was revised

Table 4.-Charges Against Gross National Product [Billions of dollars]

[^4]down $\$ 5.5$ billion in 1981 , up $\$ 6.0$ billion in 1982, and up $\$ 2.1$ billion in 1983 (table 5). Most of the revisions were accounted for by components that have already been referred to: wages and salaries, proprietors' income, rental income of persons, and personal interest income. Revisions in components of personal income not yet referred to-personal dividend income and transfer payments-were negligible to small. Revisions in personal tax payments were also negligible to small. Accordingly, revisions in disposable personal income were similar to those in personal income. The revisions in personal outlays, which were dominated by those in PCE, were downward, by large amounts in 1981 and 1982; outlays were not revised in 1983. The revisions in personal saving were up each year, by $\$ 2.1$ billion in 1981, $\$ 10.6$ billion in 1982 , and $\$ 4.4$ billion in 1983 .

In the government account, revisions in Federal receipts and expendi-
tures except those in nondefense in 1983, were small (table 6). The deficit on a NIPA basis was revised up by small amounts in 1981 and 1982 and down $\$ 3.0$ billion in 1983 . Revisions in State and local receipts were small and generally upward in 1981 and 1982; the 1983 revision, which included a moderate downward revision in indirect business taxes, was downward $\$ 5.2$ billion. Revisions in expenditures were small and upward in 1982 and 1983. The surplus on a national income and product accounts basis was revised up by small amounts in 1981 and 1982, but down $\$ 7.3$ billion in 1983.

In the foreign transactions account, the revisions in components other than exports and imports, which were discussed earlier, were negligible (table 7). Accordingly, the revisions in net foreign investment were similar to those in net exports.

Revisions in the components of gross saving and investment were all
referred to earlier (table 8). In summary, in 1981, the revision in gross saving was negligible and the revision in gross investment was upward $\$ 11.1$ billion. In 1982, gross saving and investment were revised up, both by small amounts. In 1983, gross saving was revised down by $\$ 2.4$ billion, and gross investment was revised negligibly.

## Methodological Notes

1. Seasonal adjustment.-Seasonal adjustment factors, generally calculated with the Census Bureau's X-11 program, were updated by bringing in the year 1983. The updating was routine; several special situations were examined, but they did not warrant modification of the standard proce-

dures. This updating accounted for roughly one-half of the revision in the quarterly change in GNP. As a result of the updating, the first and fourth quarters tended to be higher and the second and third quarters lower, largely reflecting the updated seasonal factors for the change in business inventories.
For imports of crude petroleum, seasonal adjustment factors were not applied to the quarters of 1982 and 1983 in the revised estimates. Highly erratic movements in these 2 years made it difficult to estimate seasonals. Crude petroleum imports for 1981, and distilled products for all years, were seasonally adjusted in the usual way.
2. Payment-In-Kind (PIK) transac-tions.-The PIK program was one of the 1983 Federal farm programs designed, in part, to reduce production and thereby reduce the large stocks of grains and cotton accumulated in 1981 and 1982. Under the PIK program, farmers could idle acreage and receive crops from Commodity Credit Corporation (CCC) inventories in return. On the basis of revised estimates, farmers took title to $\$ 5$ billion of crops previously held by the CCC in 1983. This amount reflects an upward revision of $\$ 1.5$ billion. This revision reflected better information about the dates on which the transfers were made; it was required because the unexpectedly large participation in the program caused a delay in the processing of reports on which the esti-
mates used in the NIPA's are based. In the NIPA's, these transfers do not affect gross farm product, GNP, or Federal Government expenditures. However, they do affect components of these totals. Thus, the revision in PIK transactions, although it did not affect the totals, did affect many components. Table 9 brings the most important of these components together.
In gross farm product (and also output), the reduction in CCC stocks due to PIK is a reduction in net CCC loans, which is shown in the table combined with cash receipts from marketings. This reduction is offset by an increase in farm inventories. (As shown by the table, these components of farm product (and output) were affected as well by other large revisions. These revisions reflected lower farm production-due to the midyear drought-than estimated earlier.)
In GNP, the increase in farm inventories due to PIK is offset by a reduction in CCC inventories. The latter is a reduction in Federal net purchases. Correspondingly, PIK transfers do not affect GNP seen as the sum of income components. GNP is valued at market prices-that is, exclusive of subsidies. PIK transfers appear as subsidies to farmers and are part of farm proprietors' income (or, for corporate farms, corporate profits); they are subtracted along with other subsidies as a separate item in the derivation of GNP.
In Federal expenditures, the PIK subsidy payments offset the reduction
of CCC inventories due to PIK, so that PIK transactions have no effect on total Federal expenditures.
3. International services transac-tions.-Exports and imports of services were affected by revisions in the foreign travel and direct investment income components.

Revisions of travel and passenger fare receipts reflected the resumption of tabulations of forms filed by nonresident aliens upon entry into the United States and the introduction of data from an expenditure survey, by the Bank of Mexico, of Mexicans in the border area as they returned from the United States.

The remitted and reinvested components of earnings of unincorporated affiliates of U.S. residents and of foreign residents have been separated beginning in 1982 and 1981, respectively. Previously, when the two components were inseparable statistically, both had been treated as remitted. Remitted earnings continue to be treated like dividends of incorporated affiliates. Remitted earnings of U.S. residents from their unincorporated foreign affiliates are treated like dividends received by domestic corporate business and like dividends paid by the rest of the world. Remitted earnings of foreign residents from their unincorporated U.S. affiliates are treated like dividends paid by domestic corporate business and as dividends received by the rest of the world. Reinvested earnings are now treated as undistributed corporate
profits. U.S. residents' share of reinvested earnings of their unincorporated foreign affiliates is treated as receipts of undistributed profits from the rest of the world. Foreign residents' share of reinvested earnings of their unincorporated U.S. affiliates is treated as payments of undistributed profits to the rest of the world. The amounts of the reinvested earnings are shown in footnotes to the National Income and Product Accounts Tables in tables $6.24 \mathrm{~B}, 6.25 \mathrm{~B}, 8.6$, and 8.12.

Further information is available in the discussion of the annual balance of payments revisions, which appeared in the June 1984 Survey of Current Business.
4. Interest.-The revisions in interest were the largest among the major components of charges against GNP and personal income. The methodologies for these components, which are highlighted in what follows, make them particularly subject to revision.

Net interest is estimated as part of an accounting for interest flows by sector and by legal form of organization, separately for monetary and imputed interest. The last year for which complete source data are available is 1981; for later periods, the estimates are based on less reliable source data and thus are subject to increasing margins of error. Table 10 is an arrangement of these interest estimates designed to show the sources of revision.

For years for which source data are complete, estimates of net monetary interest paid by business are derived mainly from tax return tabulations, prepared by the Internal Revenue Service, of interest paid and received by corporations, sole proprietors, and partnerships. Tabulations for corporations become available with a 3 -year lag, and those for sole proprietorships and partnerships with a 2-year lag. For years when these tabulations are not available, estimates are prepared using a different breakdown. For financial corporations, data from regulatory agencies (for example, the Federal Deposit Insurance Corporation, the Federal Home Loan Bank Board, and the National Credit Union Administration) and trade sources are used. For nonfinancial corporations, estimates are prepared by extrapolating interest paid by the product of debt outstanding for several kinds of debt (largely from the Federal Re-

serve Board's flow-of-funds accounts) and appropriate interest rates, and by extrapolating interest received using a similar procedure. Interest paid and received by partnerships and proprietorships are extrapolated by past trends. For all years, interest payments by homeowners on mortgage and home improvement loans are estimated using data on mortgages outstanding from the flow-of-funds accounts along with appropriate interest rates. For current quarters, estimates of net business interest are derived as a residual, as will be explained in connection with personal interest income.

Imputed interest is paid by two kinds of financial intermediaries: banks and other depository institutions, and life insurance carriers and private noninsured pension funds. For the former, imputed interest is estimated as the property income earned on investment of deposits less monetary interest paid on deposits (less profits, in the case of mutual depositories). For the latter, it is estimated as the property income earned less profits of mutual life insurance carriers. The sources and methods used in estimating imputed interest are simi-
lar to those used in estimating monetary interest of financial corporations for years when tax return tabulations are not available.

Net interest paid by the rest of the world is estimated as part of the U.S. international transactions accounts. The basic approach for estimating both receipts and payments is to multiply the amount outstanding in various asset categories by appropriate interest rates.

In 1981, net interest was revised down $\$ 8.9$ billion. The revision mainly reflected the incorporation of data from corporate tax return tabulations. In 1982, the revision in level was negligible and the revision in change was up $\$ 8.7$ billion. Tabulations of tax returns for sole proprietorships and partnerships, revised data on assets and debts of nonfinancial corporations from the Federal Reserve Board's flow-of-funds accounts, and revised interest rates were introduced. For 1983, the upward revision in level was $\$ 9.1$ billion and the revision in change was $\$ 9.3$ billion. A full breakdown of these revisions by component cannot be shown, because, as noted earlier, not all components are estimated separately for current quarters. Net

1. The revision in year-to-year change in a year is the revision attributable to the incorporation of new and revised source data for that year.
monetary interest more than accounted for the revision in level ( $\$ 11.8$ billion) and the revision in change ( $\$ 12.5$ billion). The revision reflected the substitution of the methodology used for annual estimates, which was just described, for the methodology used for estimates in current quarters, which is explained immediately below in connection with personal interest income.
The other major interest aggregate in the NIPA's is personal interest income. Because personal interest income cannot be estimated reliably on the basis of information either about persons' interest receipts or about the portions of interest payments by business, government, and the rest of the world that go to persons, an indirect estimating procedure must be used. The calculation used for annual estimates of personal interest income is shown in table 10: net interest (the component of charges against GNP) plus interest paid by government to persons and business less interest received by government plus interest paid by consumers to business.
For current quarters, this formula cannot be implemented because there are no data with which to estimate the portion of net interest that consists of the net monetary and imputed
interest paid by business. The procedure that is used is, in effect, to apply in reverse the formula for the annual estimates: to estimate directly personal interest income, interest paid and received by government, and interest paid by consumers to business in order to derive net interest. Personal interest income is estimated in two parts: Monetary interest is extrapolated using flow-of-funds information on assets held by persons and appropriate interest rates; imputed interest received is extrapolated by past trends. Federal Government interest is estimated largely on the basis of Treasury Department reports; State and local government interest is estimated by extrapolation of past trends. Interest paid by consumers to business is extrapolated on the basis of Federal Reserve Board information on consumer debt outstanding and on appropriate interest rates.
Most of the revisions in personal interest income in 1981 and 1982-down $\$ 9.5$ billion and negligible-reflect those in net interest. The revision in personal interest income in 1983-up $\$ 10.0$ billion-cannot be attributed to the revision in net interest. The revision in that year reflects the replacement of the direct estimate by an estimate prepared by applying the formula for annual estimates. In addition,
there were revisions in government interest, largely in interest paid and received by State and local governments. These revisions largely reflect the incorporation, for 1981 and 1982, of data from the Census Bureau's Governmental Finances.
2. Deflation of space rent.-Space rent is the rent of a housing unit exclusive of utilities furnished and of rent of equipment, such as kitchen appliances. It is a component of both owner- and tenant-occupied housing services in personal consumption expenditures and makes up the bulk of housing output. Beginning with the estimates for 1981, a new price index prepared by BEA is used in its deflation. The index is based on information from the American Housing Survey (and thus is consistent with the sample from which the mean contract rent that is used in estimating space rent is taken). The major methodological improvement is that the new index takes into account that landlords often raise (or lower) the rent they charge when they rent to a new tenant. Such changes are registered in survey data when a housing unit moves from a vacant to a rented status. Previously, space rent had been deflated using the rent component of the Consumer Price Index. The effect of the change in procedure
was to lower constant-dollar space rent by $\$ 1.9$ billion, $\$ 3.7$ billion, and $\$ 5.6$ billion in 1981, 1982, and 1983 , respectively.
3. Quarterly farm estimates.-Two improvements were introduced in the quarterly farm estimates prepared by the Department of Agriculture. For farm inventories, the quarterly pattern of change in current dollars is derived by interpolating between con-stant-dollar annual estimates of inventory change and reflating the quarterly estimates with an aggregate index of market prices. The resulting series, which shows less volatility than the previous series, appears more reasonable. Previously, the quarterly estimates were derived by
interpolating between annual estimates of current-dollar inventory change.
For cash receipts for crops, the new procedure relates to the level of detail at which seasonal adjustment is carried out. Cash receipts are the sum of open-market sales and net Commodity Credit Corporation loans. Under the new procedure, the two components are seasonally adjusted separately and then summed. Previously, the sum of the two seasonally unadjusted components was seasonally adjusted.
The revisions caused by these changes in procedure were small.
4. Quarterly pattern for rental income.-The quarterly estimates of rental income of persons from owner-
occupied housing were introduced as the interpolator and extrapolator of total rental income of persons. Rental income of persons from owner-occupied housing, which accounts for about one-half of the total, reflects quarterly movements in housing completions; the Consumer Price Indexes for rent, maintenance and repairs, property insurance; mortgage interest; local property taxes; and capital consumption allowances. Previously, the quarterly estimates of total rental income of persons were derived by fitting a smooth curve to the annual estimates and, for current quarters, by extrapolating past trends. The revisions caused by the change in procedure were small.

# ERRATA: National Income and Product Accounts 

#### Abstract

The table below shows corrections to estimates published in The National Income and Product Accounts of the United States, 1929-76: Statistical Tables. Additional errata appeared in the July and August 1982 and July 1983 issues of the Survey of Current Business.

1968

 and industrial lunchrooms.
${ }^{2}$ Includes luggage.
 excludes rent for appliances, furniture, fuel, and electricity.
${ }^{6}$ Consists of transient hotels, motels, clubs, schools, and other group housing.
7 Consists of refrigerators and freezers, cooking ranges, dishwashers, laundry equipment, stoves, air conditioners, sewing machines, vacuum cleaners, and other appliances.
 hand, power, and garden tools.

9 Consists largely of textile house furnishings including piece goods allocated to house furnishing use. Also includes lamp shades, brooms, and brushes.
 property less claims paid, and miscellaneous household operation services.

12 Consists of osteopathic physicians, chiropractors, private duty nurses, chiropodists, podiatrists, and others providing health and allied services, not elsewhere classified
 patients to proprietary hospitals, sanitariums, and nursing homes.
 health plans.

15 Consists of premiums, less benefits and dividends, for income loss insurance.
${ }_{17}{ }^{17}$ Consists of premiums, less benefits and dividends, for privately administered workmen's compensation
 commercial carriers to accident and health insurance
 ${ }_{19}$ Consists of baggage charges, coastal and inland waterway fares, travel agents, fees, and
${ }^{20}$ Consists of admissions to professional and amateur athletic events, and to racetracks including horse, dog, and auto.
${ }^{21}$ Consists of dues and fees excluding insurance premiums.
 operations; $_{23}$ and other commercial participant amusements.
 recreational sevices, not elsewhere classified.
24 Equals current expenditures (includin

 consumption allowances with capital consumption adjustment) by research organizations and foundations for education and research.
 payments within the United States and expenditures by foundations for education and research.

Nore-Consumer durable goods are designated (d.), nondurable goods (n.d.), and services (s.).

${ }_{2}^{1}$ Consists largely of foreign service and Tennessee Valley Authority.
${ }^{2}$ Consists largely of payments to nonprofit institutions and aid to students.
${ }^{3}$ Prior to 1974 , consists of old-age assistance, aid to the blind, and aid to the permanently and totally disabled. In 1974, these programs were replaced by the Federal Supplementary Security Income (SSI) program. Beginning with 1974, consists of State benefits under the SSI program. Federal SSI benefits are shown in line 25 .
${ }^{4}$ Consists largely of educational assistance, medical insurance premiums paid on behalf of
indigents, veterans bonuses, other types of veterans aid, and foster care payments.

Table 3.15.-Government Expenditures by Function
[Millions of Dollars]

|  |  |
| :--- | :--- |

${ }^{1}$ Equals Federal government expenditures less grants-in-aid to State and local goverments plus State and local government expenditures. These data include employee compensation on a disbursement basis. The estimates by function include employee compensation on an accrual basis. Wage accruals less disbursements (in millions of dollars) is as follows: 1980, -40 ; 1981, 59 ; 1982 -4; 1983, - 445 .
${ }_{2}$ Excludes interest received by State and local social insurance funds, which is netted against expenditures for the appropriate functions.

${ }_{2}^{1}$ Includes reinvested earnings of incorporated affiliates.
${ }^{2}{ }^{2}$ Beginning in 1960 , the treatment of net exports of gold in the NIPA's differs from that in the BPA's. BPA gold exports (line 2) and imports (line 9) are removed frem the NIPA's. Imports of net exports of gold in the NIPA's and BPA's is identical, and is the same as the present NIPA treatment
${ }^{3}$ BPA capital gains and losses included in UU.S. direct investment income abroad (line 3) and in foreign direct investment income in the U.S. (line 10) are removed from the NIPA's beginning in 1978; data needed to remove them from the NIPA's in earlier years are not available.
${ }_{5}^{4}$ Consists of statistical revisions in the BPA's that have not yet been incorporated in the NIPA's.
${ }^{5}$ Consists of arms shipments to Israel financed under the Emergency Security Act of 1973 and subsequent legislation. In the NIPA's, these arms shipments are classified as military grants, which are included in the defense purchases component of GNP when they are acquired by the U.S. Government. Their transfer abroad is not reflected in the NIPA's.
${ }^{\circ}$ Represents interest paid by government to foreigners. This item is treated as an import of services in the BPA's. In the NIPA's, it is excluded from government purchases and, thus, also from ${ }_{7}{ }_{7}{ }_{7}$
United Stsists of a U.S. Government payment to India under the Agricultural Trade Development and Assistance Act. In the NIPA's, this payment is included in capital grants received by the ${ }^{\mathbf{s}}$ Consists of financing provided to Israel in accordance with the Emergency Security Act of 1973 and subsequent legislation.
$r$ Balance-of-payments accounts lines are revised for 1980 .

${ }^{1}$ In this table, purchases of structures includes compensation of government employees engaged in new force-account construction. In table 1.4 this compensation is classified as a
service and is included as part of government compensation of employees. service and is included as part of government compensation of employees.
2 Consists of hotels and motels, buildings used primarily for social and receational activities, and buildings not elsewhere classified, such as passenger terminals, greenhouses, and animal
hospitals.
Consists of streets, dams and reservoirs, sewer and water facilities, parks, airfields, etc
${ }_{5}^{4}$ Consists of dormitories, fraternity and sorority houses, nurses' homes, etc.
${ }^{5}$ Consists of general office buildings, police and fire stations, courthouses, auditoriums,
garages, passenger terminals, etc.
6 Consists of electric and gas facilities, transit systems, airfields, etc.

${ }^{1}$ Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from current-dollar inventories in this table is not the current-dollar change in business
nentories (CBI) component of GNP. The former is the difference between two inventory stocks, each valued at their respective end-of-quarter prices. The latter is the change in the physical volume inventories (CBI) component of GNP. The former is the difference between two inventory stocks, each valued at their respective end-of-quarter prices. The latter is the
of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarterly rates, whereas CBI is stated at annual rates.
${ }_{3}$ Prior to 1959, inventories held by construction establishments are included in line 5 . In 1959 , the value of inventories held by construction establishments was $\$ 2.6$ billion. ${ }^{3}$ Quarterly totals at monthly rates. Business final sales equals final sales less gross product of households and institutions, government, and rest of the world, and includes a small amount of
final sales by farms.

${ }^{1}$ Full-time equivalent employees equals the number of employees on full-time schedules plus the number of employees on part-time schedules converted to a full-time basis. The conversion is meekly hours per employee on part-time schedules to average weekly hours per employee on full-time schedules in each industry.

${ }^{1}$ Except for farm proprietorships and partnerships (line 14) and other private business (line 18), the capital consumption adjustment is calculated in two parts. The adjustment for depreciation schedules employed by firms when filing their income tax returns to consistent service lives and straight line depreciation schedules. The adjustment for current replacement cost converts the historical cost series with consistent accounting to a current replacement cost
series. For farm proprietorships and partnershipe and other private business the historical coet series. For farm propriotorships and partnerships and other private business the historical cost
series is based on consistent service lives and straight line depreciation schedules so that the series is based on consistent service lives and straight line depr
$\underset{\mathbf{Z}}{\mathbf{2}}$ Fixed capital onty a conversion to current replacement cost.
${ }^{2}$ Fixed capital assets owned and used by these entities are considered to be business activities selling their curront serviees to their owners. The value of these services is included in personal consumption allowances with capital consumption adjustment.

For 1981, includes depreciation on railroad track previously charged to current expense. 2 The estimate shown in line 12 for 1980 is for all industries, and the estimates shown for 1981 and 1982 are for nonfarm industries. Estimates of farm depreciation and amortization are available for 1981 and 1982 for corporations and partnerships but not for sole proprietorships.

2. Equals the ratio of the implicit price deflator for exports of goods and services to the implicit price deflator for imports of goods and services.

# The Economy and the Federal Budget: Guides to the Automatic Effects 

TTHE prospect of large Federal budget deficits over the remainder of the decade has stimulated substantial interest in how the budget is affected by changes in economic conditions. Economists and policymakers are especially interested in determining how much of the deficit will disappear "automatically" with economic expansion, declining unemployment, and inflation, and how much must be dealt with by specific policy changes.

That the budget is very sensitive to changes in economic conditions is dramatically illustrated by the fiscal year 1983 budget. When the 1983 budget was originally submitted to Congress in February 1982, the deficit was estimated to be $\$ 91.5$ billion. By September 1983, the end of the fiscal year, the actual deficit was $\$ 195.4$ billion. Overly optimistic assumptions about economic conditions accounted for $\$ 67.2$ billion, or about two-thirds, of the $\$ 103.9$ billion difference between the actual and estimated 1983 deficit. ${ }^{1}$

The relationship between economic conditions and the budget is not a simple one. However, rough guides, or rules of thumb, can be developed to approximate some of the most important aspects of this relationship. This article presents one such set of rules for the: Federal budget on a national income and product accounts (NIPA) basis. ${ }^{2}$ In brief, after about 1 year:

- Each 1-percentage-point increase in the unemployment rate increases the deficit by about $\$ 25-\$ 30$ billion.

1. The developments that affected the fiscal year 1983 deficit over this 18 -month period are discussed in Joseph C. Wakefield, "Anatomy of a Federal Government Deficit, Fiscal Year 1983," Survey of Current Business 64 (March 1984): 19-22.
2. Results based on NIPA measures are suggestive of the effects on the unified budget, but may not be exactly the same because of differences-such as timing and coverage-between the NIPA and unified budgets

- Each $\$ 100$ billion increase in cur-rent-dollar GNP decreases the deficit by about $\$ 34-\$ 38$ billion.
- Each 1-percentage-point increase in the inflation rate decreases the deficit by about $\$ 7-\$ 9$ billion.

All three rules are symmetrical; decreases in the unemployment rate, in the inflation rate, and in currentdollar GNP cause the deficit to change by the indicated amount, but in the opposite direction. To simplify the exposition, the remainder of this article discusses only increases or decreases in the indicators of economic conditions, not both increases and decreases.

These rules must be applied carefully. They are formulated to use in analyzing the budget in 1983-85. The first and third need to be scaled to the size of the economy if they are to be used in the analysis of a different time period.

In addition, each is designed to indicate the budgetary effects of a specific change in an economic condition while other relevant factors-such as other economic conditions-are unchanged. If these factors change simultaneously, the rules may not apply.

Moreover, the rules indicate average annual effects. Readers interested in the quarterly pattern of those effects are referred to the technical note at the end of this article. It presents simplified estimation procedures that closely approximate the results of the detailed model BEA uses to cyclically adjust the budget. These procedures may be used to simulate the quarterly pattern of budgetary effects.

The rules of thumb were derived from simulations of the models that BEA uses to cyclically adjust the budget and to estimate inflation-induced changes in the cyclically adjusted budget. The general procedure is the same for all three simulations.

First: Estimate the cyclically adjusted budget or inflation-induced changes in the cyclically adjusted budget with the appropriate model. ${ }^{3}$

Second: Alter an indicator of economic conditions to represent the change that is to be studied (e.g., a 1 -percentage-point increase in the unemployment rate).

Third: Reestimate the appropriate model based on the altered indicator of economic conditions.

Fourth: Compare the results of the third step with those of the first step to determine the effects on the budget of the change in economic conditions.

How these steps are implemented is discussed with each simulation.

## Unemployment rate increase

An increase in the unemployment rate directly increases unemploy-ment-sensitive Federal expenditures such as unemployment insurance benefits and food stamp benefits. In addition, a 1-percentage-point increase in the unemployment rate is typically associated with a decrease in con-stant-dollar GNP of about 2 percent. ${ }^{4}$

[^15]The simulation, therefore, incorporates a decrease of this magnitude in constant-dollar GNP. This decrease in constant-dollar GNP (holding the price level constant) implies a decrease in dollar amounts subject to tax and, therefore, a decrease in receipts. The overall effects on both expenditures and receipts move the budget toward deficit.
Table 1 shows the simulation results of the effects on the budget of a 1-percentage-point increase in the unemployment rate for recent years. The unemployment rate increase was incorporated in the simulation by (1) increasing the gap between the actual unemployment rate and the trend unemployment rate by 1 percentage point, and (2) increasing the GNP gap-defined as trend GNP less actual GNP, divided by trend GNPby about 2 percentage points, as noted. ${ }^{5}$ The full budgetary effects take about 1 year to develop because many of the equations in the model to cyclically adjust the budget have lag terms. The simulated cyclically adjusted budget-averaged over a year beginning with the fifth quarter of the simulation-was compared with the cyclically adjusted budget without the 1-percentage-point unemployment rate increase to determine the effects of the increase. ${ }^{6}$
The estimates in table 1 show the effects on receipts, on expenditures with and without an adjustment for net interest paid, and on the corresponding surplus or deficit. The adjustment of net interest paid is singled out because, unlike other categories of cyclically sensitive receipts and expenditures, its relationship to changes in the unemployment rate is ambiguous in the short run. ${ }^{7}$ The reason is that the two principal factors affecting net interest paid re-
5. An increase in the gap can be accomplished by changing the actual or trend levels. The effects on the budget are approximately symmetrical Price levels were assumed to remain at their actual values.
6. Specifically, the simulations begin in the first quarter of the year preceding the year for which the effect is estimated. For example, the estimates for 1980 are the averages of the effects on the budget for the four quarters of 1980 based on an initial adjustment to the gaps in the first quarter of 1979.
7. The estimates of the cyclically adjusted budget and inflation-induced changes in the cyclically adjusted budget focus on short-run effects. For this reason, the adjustments of net interest paid require estimates of the effects of the cycle and inflation on the stock of debt and on interest rates for only four quarters. Effects would continue to develop over many quarters.

Table 1.-Effects on the Budget of a 1-Percentage-Point Increase in the Unemployment Rate [Billions of dollars]

|  | Recerpts | Expenditures |  | Surplus or deficit |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Total | Excluding net interest pard | Total | Excluding net interest paid |
| 1980 | -152 | 41 | 59 | -193 | -211 |
| 1981 | -176 | 47 | 62 | -223 | -238 |
| 1982 | -185 | 43 | 62 | -22.8 | -247 |
| 1983 | -199 | 37 | 66 | -23.6 | -265 |

spond to changes in the unemployment rate in opposite ways. Said simply, net interest paid can be viewed as an effective interest rate times the stock of net debt (debt on which the Federal Government must pay interest minus loans on which the Federal Government receives interest). An increase in the unemployment rate is often associated with a decline in interest rates in the short run. At the same time, an increase in the unemployment rate is often associated with an increase in net debt because debt increases to finance larger deficits. The simulation results in table 1 imply that the short-run effects on interest rates outweigh the short-run effects on net debt. ${ }^{8} \mathrm{Be}$ cause even the sign of the net interest paid adjustment is sensitive to the estimation techniques, the estimates are shown both including and excluding the adjustment.

The simulation results suggest that the budgetary dollar effects of a 1-per-centage-point increase in the unemployment rate have grown with the economy. By 1983, the higher unemployment rate increases the deficit by about $\$ 24$ billion including the adjustment of net interest paid and about $\$ 27$ billion excluding the adjustment. If the unemployment rate had been 10.6 percent in 1983 instead of the actual 9.6 percent, the results suggest that the deficit would have been $\$ 206$ billion or $\$ 209$ billion, respectively, instead of the actual $\$ 182$ billion.

[^16]To obtain a rule of thumb applicable to 1984-85, the dollar effects calculated for 1983 must be scaled for growth of the economy. The scaling factor is the ratio of (1) middle-expansion trend GNP series in 1984-85 (expressed in current dollars by using the administration's forecasts of price levels) to (2) current-dollar middle-expansion trend GNP in 1983. The 1984-85 rule of thumb, then, is that a 1-percentage-point increase in the unemployment rate increases the deficit by about $\$ 25$ to $\$ 28$ billion including the adjustment of net interest paid and by about $\$ 28$ to $\$ 31$ billion excluding the adjustment.

## Current-dollar GNP decrease

A decrease in current-dollar GNP implies a decrease in income subject to tax and a decrease in receipts. The effects on expenditures depend on whether the decrease is caused by a fall in constant-dollar GNP, a fall in the level of prices, or a combination of the two. In this simulation, a $\$ 10$ bilhion decrease is assumed to be entirely due to a decrease in constantdollar GNP. The relationship between constant-dollar GNP and the unemployment rate is also used here, so a decrease in current-dollar GNP will be accompanied by an increase in un-employment-sensitive expenditures. The overall effects on both receipts and expenditures move the budget toward deficit.

The simulation was done by calculating GNP and unemployment rate gaps consistent with a $\$ 10$ billion decrease in current-dollar GNP in
1982.9 The full budgetary effects take about 1 year to develop. The simulation results for 1983 suggest that the increase in the budget deficit is equal to a little over one-third of the decrease in current-dollar GNP. More precisely, the simulation indicates that the increase in the deficit amounts to about 34 percent of the decrease in current-dollar GNP when an adjustment of net interest is included in the budget measure and about 38 percent when the adjustment is excluded. In both cases, receipts decrease by an amount equal to about 29 percent of the decrease in GNP; expenditure increases account for the rest of the deficit change. Because the simulation results are expressed as percentages, they need not be scaled to the size of the economy. Thus, if current-dollar GNP had been $\$ 3,211$ billion in 1983 instead of the $\$ 3,311$ billion it actually was, the rule says that the deficit would have been $\$ 216$ billion or $\$ 220$ billion, respectively, instead of the actual $\$ 182$ billion.

## Inflation rate increase

Inflation automatically increases receipts because higher prices mean higher dollar amounts subject to tax. Historically, in the case of the individual income tax, inflation has also resulted in higher marginal tax rates being applied to these higher dollar amounts. This "bracket creep" is scheduled to be eliminated in 1985; the Economic Recovery Tax Act of 1981 provides for indexation of the individual income tax-automatic increases in personal exemptions and tax brackets in proportion to increases in a price index.

On the expenditure side, many programs are linked directly or indirectly to changes in some measure of the general price level. Because the effects on receipts have tended to be larger than the effects on expenditures, inflation has historically tended to move the budget toward surplus.
9. The $\$ 10$ billion decrease in current-dollar GNP is analyzed in the simulations by increasing the currentdollar difference between actual and trend GNP by $\$ 10$ billion. The increase is accomplished by a $\$ 10$ billion increase in current-dollar trend GNP.

Table 2.-Effects on the Budget of a 1-Percentage-Point Increase in the Inflation Rate, Without and With Indexation of the Individual Income Tax
[Billions of dollars; seasonally adjusted at annual rates]

| Number of quarters after the increase in the inflation rate (first quarter $=1979: 1$ ) | Without indexation |  |  | With indexation |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Receipts | Expenditures | Surplus or deficit | Receipts | Expenditures | Surplus or deficit |
| 4 ........................................................................ | 7.3 | 1.9 | 5.5 | 6.0 | 1.9 | 4.2 |
| $8 .$. | 16.4 | 5.2 | 11.2 | 13.2 | 5.2 | 8.0 |
| 12. | 24.0 | 8.7 | 15.4 | 18.5 | 8.7 | 9.9 |

Table 2 shows the simulation results of the effects on the budget of a 1 -percentage-point increase in the inflation rate without and with indexation of the individual income tax. Indexation was incorporated by assuming that the elasticity of personal income tax receipts with respect to in-flation-induced changes in income subject to tax was 1.0 instead of the much higher values ( 1.63 to 1.66 ) that applied historically.

The simulation was done by increasing the rate of inflation 1 percentage point (at an annual rate) above the actual inflation rate starting in the first quarter of 1979. Because inflation is a measure of price change over time, the simulation shows the effects on the budget after 4 quarters, 8 quarters, and 12 quarters. ${ }^{10}$

The effects on receipts without indexation of the individual income tax are larger than those on expenditures and develop more quickly. The complete budgetary effects on some indexed expenditures-those linked by legislation to changes in a price index-take more than 1 year to occur. The simulation provides a rule that suggests that at the end of four quarters, the cumulative effects of a 1-percentage-point increase in the inflation rate move the budget about $\$ 6$ billion toward surplus. At the end of 8 and 12 quarters, the corresponding amounts are about $\$ 11$ billion and about $\$ 15$ billion, respectively. If, starting in the first quarter of 1979 , the inflation rate had been 1 percentage point higher that it actually was, the simulation result suggests that by

[^17]the end of 1981 , the deficit would have been about $\$ 81$ billion instead of the actual $\$ 96$ billion.

The effects on receipts are reduced with indexation, but the simulation results suggest that inflation still tends to move the budget toward surplus. At the end of four quarters, the cumulative effects move the budget about $\$ 4$ billion toward surplus. At the end of 8 and 12 quarters, the corresponding amounts are about $\$ 8$ billion and about $\$ 10$ billion, respectively.

Because the budgetary effect of inflation is expected to increase with the economy, the rule of thumb for 1983-85 is derived by scaling the 1979-81 simulation results in the same way that the unemployment rate results were scaled. The $1983-85$ rule is that the cumulative effects of a 1-percentage-point increase in the inflation rate starting in the first quarter of 1983 will move the budget about $\$ 7$ to $\$ 9$ billion toward surplus after 4 quarters (the end of 1983), $\$ 14$ to $\$ 16$ billion after 8 quarters (the end of 1984 ), and $\$ 16$ to $\$ 19$ billion after 12 quarters (the end of 1985). ${ }^{11}$

## Technical Note

The simulations discussed in the text provide general guides to the average effects on the budget of changes in economic conditions, but are not designed to generate quarterly estimates. The complete model that BEA uses to cyclically adjust the budget does provide quarterly estimates, but it is complex and requires many unpublished time series. ${ }^{12}$ The size and

[^18]data requirements of the complete model preclude many applications where a rapid, even if approximate, solution is needed. For these applications, simplified estimation procedures have been developed that closely approximate the results of the complete model.

The simplified procedures consist of three equations; they estimate cyclical adjustments (i.e., differences between cyclically adjusted and actual levels) for total receipts, total expenditures, and the surplus or deficit: ${ }^{13}$
(1) $T G U=1.4266 g\left(\frac{\mathrm{G}^{*}-1}{G}\right) T G F$
(2) $E G U=(-0.00153 U R-0.00049 U R T R I G$

$$
\begin{aligned}
& -0.00010 \sum_{i=1}^{4} U R_{-i}+0.0047 g \\
& +\left(0.0182 g_{-1}+0.0106 g_{2}+0.0048 g_{-3}\right.
\end{aligned}
$$

$$
\left.+0.0027 \sum_{i=4}^{7} g_{-i}\right) G^{*}
$$

(3) $S G U=T G U-E G U$
where:
$T G U=$ estimated cyclical adjustment of receipts;
$E G U=$ estimated cyclical adjustment of expenditures;
$S G U=$ estimated cyclical adjustment of the surplus or deficit;
$G^{*}=$ middle-expansion trend GNP;
$G=$ actual GNP;
$T G F=$ actual receipts;
$U R=$ actual less trend unemployment rate;
$U R T R I G=U R$ when the national trigger was on, zero otherwise;
$g=$ GNP gap $\left(1-\left(G / G^{*}\right)\right.$ ).
All dollar amounts are in current dollars. Estimates of the levels of the cyclically adjusted budget are obtained by adding the estimates from equations (1)-(3) to the appropriate components of the unadjusted budget.
As chart 8 shows, the simplified procedures capture almost all of the quarterly variation in the complete model's estimates for receipts and expenditures in the 1970-83 period, although estimates from the simplified procedures are generally below those

[^19]
## CHART 8 <br> Cyclically Adjusted Less Actual Budget Measures Based on the Complete Model and on the Simplified Estimation Procedures <br> Billion \$

U.S. Department of Commerce, Bureau of Economic Analysis
of the complete model. For receipts, the correlation coefficient between the estimates of the simplified procedures and the complete model is 0.998 , and the root mean square error is $\$ 1.9$ billion; for expenditures, the correlation coefficient is 0.975 , the root mean square error is $\$ .9$ billion; and for expenditures without the adjustment of net interest paid, the correlation coefficient is 0.999 , the root
mean square error is $\$ .1$ billion. (Expenditures without the adjustment for net interest paid are estimated by omitting all of the GNP gap (g) terms from equation (2).) Cyclical adjustments of the surplus or deficit from the two models may be compared by combining the top and middle panels of the chart or, excluding the adjustment for net interest paid, the top and bottom panels of the chart.

# The Underground Economy: An Introduction 

This article began in the May 1984 Survey of Current Business (pages 21-37). The three parts in that issue were:
I. Underground Activities.-A sorting out of the activities that are covered by the term "underground economy," a review of incentives to engage in these activities, and a discussion of some definitional issues;
II. Measurement: Methods and Re-sults.-A synopsis of the various
methods that have been used to measure the underground economy or parts of it, and a roundup of results for the United States;
III. Implications. $-A$ survey of the implications of the underground economy, emphasizing its implications for the major economic statistics.

The concluding part was held until this month so that it could take into
consideration BEA's improved adjustments for misreporting of tax return information used to estimate the national income and product accounts, which were presented in the June Survey.

Full citations for most sources mentioned in the text and tables are provided in the bibliography on pages 3637 of the May Survey. Additional sources, denoted by a superscript ${ }^{\circ}$, are in the bibliography that is on page 117 of this issue.

## IV. The Underground Economy and the U.S. National Income and Product Accounts

This part of "The Underground Economy: An Introduction" takes up three topics, one from each of the preceding parts, for fuller discussion in the context of the U.S. national income and product accounts (NIPA's) prepared by BEA. These topics, which require somewhat more technical discussion than in earlier parts of the article, are: illegal activities, three sets of NIPA estimates sometimes misunderstood as being measures of the underground economy, and the effect on NIPA estimates of possible misreporting in source data due to the underground economy.

## Illegal activities

In part I, a distinction was drawn between illegal activities and other underground activities (that is, activities that are legal except that they, or the income from them, are not report-
ed, as required, to tax, immigration, licensing, or other authorities). Further, it was noted that illegal activities are excluded from the NIPA's. In what follows, the pros and cons of excluding these activities from the NIPA's are reviewed, some of the problems of implementing the exclusion are mentioned, and the measurement of illegal activities in a NIPA framework is considered.

Exclusion of illegal activities from the NIPA's.-Questions about the handling of illegal activities in economic accounts are not new. Because the early focus in national economic accounting was on the measurement of production, an obvious question was about where, with regard to these activities, to draw the production boundary-that is, the boundary within which coverage was intended. Early estimators of U.S. national income grappled with the issue enough that by 1954, National Income ${ }^{\circ}$, the reference volume on NIPA methodology could refer to the exclusion of these activities as a "tra-dition-based convention."
At least one of two reasons, and occasionally both, have been given for
the exclusion of illegal activities. First, the nature of these activities speaks for their exclusion. Expressions of this idea have varied slightly in their emphasis: the "illegality [of these activities], allowing for the lag of the legal statute behind public opinion, implies their disserviceability to society at large," they are "antisocial activities," and "representatives of the people have determined . . . products [of these activities] to be 'bads' rather than 'goods' with sufficient conviction to outlaw them" ( Na tional Income, 1929-32 ${ }^{\circ}$, National Income, $1929-35^{\circ}$, and Denison, respectively). Second, measurement of illegal activities is very difficult. To a large extent, they must be deliberately concealed if they are to take place at all. ${ }^{20}$

In the exclusion of illegal activities, the production boundary defined for

[^20]the NIPA's differs from the one that appears to be the guide for most other countries. Most countries generally follow the System of National Accounts, which is maintained by the United Nations as a guide for the preparation of economic accounts and as a format for international reporting. In the first version (1953) of that System, the production boundary was defined specifically to include all transactions-legal as well as ille-gal-in which receipts were obtained with the unenforced consent of the payer. The next version (1968) did not mention this issue of coverage, but the omission was an oversight. Explicit coverage of illegal transactions has been proposed for the revision of the System targeted for 1990. Even for those who support the proposal, it is an open question whether countries should attempt to provide a full set of estimates-for example, annually and as a part of their regular accounts. A survey of member countries of the Organization for Economic Cooperation and Development revealed that, at present, lack of data generally prevents these countries, which have the world's most fully developed statistical systems, from including illegal activities in their economic accounts (Blades 1982).

The fact that the exclusion-in concept, at least-of illegal activities is not universal suggests that the case for it is not clear cut. First, it is argued that estimates of illegal activities are no more difficult to prepare than are some components of the economic accounts that are estimated. Second, it is argued that application of the legality criterion reduces the comparability of economic accounts over time and across national boundaries. Over time, views change about the social acceptability of goods and services, and changing views as expressed in law, introduce noncomparabilities in economic time series. The prohibition of alcoholic beverages by constitutional amendment in 1920 and its repeal in 1933 is a striking example of change in legal status. (One can see the effect on time series in the NIPA's: from 1929, when the series began, to 1932, the detailed breakdown of personal consumption expenditures shows zeros for alcoholic beverages.) Also, laws differ from country to country. More activities are illegal in the United States than in most other developed countries. In
several European countries, prostitution is legal, and gambling laws are much less restrictive in most. (See Dowie, James S. Henry 1983, and Blades 1982 and 1983.)

The statement that illegal activities are outside the production boundary needs some elaboration. ${ }^{21}$ First, what is at issue are prohibitions on activities that would, on the basis of all other criteria, be considered production as defined in the NIPA's-growing, manufacturing, or distributing a good, or providing a service. ${ }^{22}$ The Controlled Substances Act of 1970 is an example of such a prohibition; it prohibits the unauthorized manufacture, distribution (that is, delivery by sale, gift, or otherwise), or possession of a variety of substances-narcotics, depressants, stimulants, hallucinogens, and cannabis-designated as controlled substances. At present, in addition to drugs, the main prohibi-tions-incorporated in State and local as well as Federal laws-are of illegal gambling and prostitution. Previously, prohibitions also extended to alcoholic beverages and to abortions.
Second, what is to be excluded from GNP is the value of the goods and services produced despite the prohibition. The exclusion does not carry backward or forward. The materials that enter into the production of an illegal good, unless illegal on their own, are not excluded, nor are the goods purchased out of income earned in illegal production.

Third, the exclusion of a good or service generally is not to depend on the legal status of producers. More specifically, the illegal status of a producer is not to lead to the exclusion from GNP of products that are legal. For example, if producers evade taxes, ignore the minimum wage laws, or are racketeers or illegal aliens, their products are not excluded from GNP if the products

[^21]themselves are legal. A gray area exists in the case of producers who are supposed to be licensed or certified but are not. Denison draws a distinction between medical services provided by an untrained and unlicensed dispenser, on the one hand, and those of a trained but unlicensed dispenser, on the other hand; he suggests that the former should be excluded from GNP but that the latter should be included.

The three statements above deal with the intent of the NIPA's with respect to illegal activities. In at least two ways, practice may differ from intent. First, source data used to estimate some NIPA components include some production, and income from production, of illegal goods and services that are reported as legal. Because the illegality of an activity does not affect liability to pay Federal income taxes, some illegal activity is included in "laundered" form on tax returns used to derive NIPA estimates. ${ }^{23}$ Similarly, censuses and surveys of establishments are likely to include some illegal sales disguised as legal. Because there has been no way to adjust for laundered income or disguised sales, GNP includes some amount of production of illegal goods and services. Second, theft from business, although it is an illegal activity that is essentially redistribution rather than production, may-for statistical reasons-affect the measurement of production. If, as is one possibility, goods stolen from businesses are not "fenced," but are consumed by the thief, they probably are not included in GNP even though they should, in concept, be included. (They are not included because businesses usually write down inventories to reflect such losses.)

Measurement of illegal activities in a manner consistent with the NIPA's.-Although illegal activities are excluded from the NIPA's, there is substantial interest in measuring

[^22]them, and there are advantages to doing so in a manner consistent with the NIPA's. If they were measured in this manner, it would be possible to compare the size and growth of illegal activities with other parts of the underground economy and with the regular economy. Also, the use of a consistent conceptual and statistical framework may provide useful crosschecks. Two aspects of measurement consistent with the NIPA's should be noted in particular.
The first deals with the measures of production. Measures of illegal activi-ty-in concept, if not necessarily in practice-can be derived to be consistent with both the income- and prod-uct-side approaches to measuring GNP. The characteristics of measures consistent with the two approaches should be clear, to avoid misuse or inappropriate comparisons. In particular, it should be clear that measures consistent with GNP differ from a form in which information about illegal activities is sometimes available. An example using marihuana-a drug whose production and distribution is illegal in the United Stateswill help point out these characteristics. ${ }^{24}$

As a simplification, the example is limited to imported marihuana, which makes up the bulk of what is distributed in the United States. Marihuana, a kind of hemp, usually enters the United States in large bales of several hundred pounds each. As is typical of the illegal drug trade, it passes from the importer through a long chain of dealers. Each cuts the size of the parcel, from the bales down to the one pound or less that reaches the user, and aims to make a profit by selling at a higher price than paid.

At the end of the chain, users' price times quantity consumed would yield the total retail value of imported marihuana. This value can be summed along with similarly derived values for other goods and services to derive total production as the sum of prod-ucts-the familiar "consumption + investment + government purchases + exports - imports" equation. Total

[^23]Table 6.-The AGI Gap, Adjustments for Taxpayer Misreporting, and the Statistical Discrepancy

AGI= adjusted gross income.

1. Estimates are as of the July 1984 annual NIPA revisions. See footnote 2.
2. Prior to the improvements described in Parker ${ }^{\circ}$, personal income and charges against GNP had included adjustments of $\$ 11.5$ billion and $\$ 23.7$ billion, respectively, in 1977; GNP had not included adjustments. The improvements are now incorporated only in the preliminary revised estimates for 1977 and will be extended to earlier and later periods for incorporation into the NIPA's in the comprehensive revisions scheduled for the end of 1985.
production measured this way is an unduplicated measure in that purchases of one producing unit from another of intermediate products are not separately added in; the value of each term of the equation includes all the intermediate products purchased by a producing unit from another. Thus, the retail value of imported marihauna consistent with the consumption term of the equation includes the value of intermediate products (such as packaging materials), as well as the value of imports and incomes earned along the chain of marihuana distribution.
For the sum-of-incomes approach, it is useful to view the illegal activityin this case, distribution of imported marihuana-as an "industry." The production of-that is, value added by-this industry is the sum of incomes earned along the distribution chain. Total turnover, which is the sum of the sales made along a chain, would differ from value added because it would include the purchases by this industry from others.
So far the discussion has centered on measures of production. Illegal activities that do not yield productthat is, are not production-did not enter the discussion because they would not be in GNP even if the production boundary were changed. Theft was mentioned earlier as an example of an illegal activity that is essentially not production, but redistribution of income and property. However, the NIPA's do more than provide a measure of production; they provide an overview of the economic
process-how industries contribute to production, what kinds of incomes are received, and how incomes are spent. This characteristic leads to the second aspect of measurement of illegal activities consistent with the NIPA's that should be noted: A full NIPA treatment would require attention to illegal activities not considered production.

For a full NIPA treatment, the relevant illegal activities-going beyond production to include activities such as various forms of theft, bribery, fraud, and extortion-would be laid out as sets of economic transactions. Then, these transactions would be classified as one of the types of transactions within the NIPA framework (as shown, for example, in the five-account summary system on page 18 of this issue). This process can be illustrated with shoplifting. One possible treatment is to consider the goods stolen as "personal consumption without expenditure" and as "unintended business transfer payments to persons," from the point of view of the shoplifters. From the point of view of business, the treatment would include the losses explicitly in transfer payments to persons.
Only exploratory work of this kind has been done (see especially Blades 1983). BEA has underway a pilot study to measure illegal activities within the framework of a full NIPA treatment.
Finally, it should be noted that, as just described, measurement of illegal activities in a NIPA framework does not encompass measuring the effects
of illegal activities. For example, in the case of shoplifting, measurement in the NIPA framework does not extend to the identification of costs incurred by business to purchase protective devices or hire guards or of expenditures by government to maintain police and judicial systems. It is not that the effects would not be interesting or useful to measure; they would be, but such a study would be essentially different in nature.

## Misunderstood estimates

In the roundup of estimates of the U.S. underground economy in part II, BEA was not listed among the estimators, because BEA does not now prepare estimates of the size of the underground economy. ${ }^{25}$ However, BEA does prepare three sets of NIPA estimates that have been, or are likely to be, misunderstood as providing measures of its size, growth, or both. Each estimate-the adjusted gross income (AGI) gap, the adjustments for taxpayer misreporting, and the statistical discrepancy-is a difference, or residual, that is misunderstood as isolating the underground economy.

The three sets are shown in table 6 for 1977, the year for which all are now available, and for 1973-82 for the two that are time series. It is readily apparent from the table that, as a minimal conclusion, they could not all be appropriate measures. Their sizes in 1977 are vastly different, ranging from $\$ 1$ billion to $\$ 94$ billion. One of the time series shows no growth from 1973 to 1982, and the other one more than doubles.

The following review of the coverage of the three estimates will confirm that they should not be pressed into service as measures of the underground economy.
$A G I$ GAP.-BEA prepares an annual reconciliation of adjusted gross income (AGI), an Internal Revenue Service aggregate, with personal income. ${ }^{26}$ AGI, which is published in the Statistics of Income series, is the total income from all sources that is

[^24]subject to Federal individual income tax less certain deductions (such as various expenses considered necessary in earning income). Personal income, as defined in the NIPA's, is income received by persons from participation in production, from transfer payments from government and business, and from government interest. Personal income and AGI each contain items that the other omits, so that the reconciliation consists of subtracting from personal income the items not included in AGI and adding the portion of AGI not included in personal income. The difference between the resulting aggregate and the Internal Revenue Service measure of AGI is the "AGI gap."

Although it has been referred to as a measure of the underground economy because it is viewed as isolating the major part of underground income that is not reported on income tax returns, the AGI gap is not such a measure. It does include some of the incomes related to the underground economy; specifically, it includes the amounts added to personal income to correct for the effects of misreporting on tax returns (see the following subsection). However, the gap is neither limited to underground incomes, nor does it cover all of them. The gap includes, for example, income earned by individuals whose income is below the filing threshold for income tax returns, although this income is not necessarily income earned in the underground economy. (It also includes errors and omissions in the reconciliation items, the net effect of sample errors in AGI, and the net effect of errors in source data used to estimate personal income.) It excludes any income that, although considered underground because it is not reported to the Internal Revenue Service, is not within scope for personal income. Thus, for example, the gap would not cover underground capital gains. Further, illegal activities are, for all practical purposes, not included in the gap. They are included only to the extent that more illegal income is reported in laundered form in the source data for personal income (which includes, but is not limited to, tax return information) than is reported in laundered form to the Internal Revenue Service in AGI. ${ }^{27}$

[^25]Adjustments for taxpayer misreport-ing.-For many years, BEA has made adjustments to correct NIPA estimates for the effects of taxpayer misreporting on the tax returns used as source data. ${ }^{28}$ Recently, information from studies by BEA and other Government agencies on the underground economy's impact on NIPA source data provided the basis for substantial improvement. The improved set of adjustments was presented in the June Survey (see Parker ${ }^{\circ}$ ).

For several reasons, the adjust-ments-or, as they may be viewed, the differences between adjusted NIPA estimates and their unadjusted counterparts-do not provide a measure of the underground economy. First, some underground activities do not take the form of misreporting on tax returns, and the adjustments do not reflect these activities. Second, even if all underground activity did take the form of misreporting on tax returns, not all NIPA components are derived from tax returns, and therefore do not require an adjustment. For example, as noted in table 1 (page 22 of the May Survey), covert rentals are not a reason for a NIPA adjustment because the method of estimating rent does not rely on the rent recipient's report of that income to the Internal Revenue Service. Finally, the adjustments do not cover illegal activities. ${ }^{29}$

Statistical discrepancy.-The use of the difference between an income estimate and an expenditure estimate as a measure of the underground economy stems from the expectation that, in general, income is underreported more, especially when income is estimated from tax return information. This difference has been used as a measure of the size and growth of

[^26]the underground economy in several countries (see the synopsis of Macafee in table 2). ${ }^{30}$

In the NIPA's, the statistical discrepancy is the difference between the estimate of GNP, a "product-side" measure (the sum of expenditures on goods and services produced), and the estimate of charges against GNP, an "income-side" measure (the sum of factor and nonfactor charges originating in the production of GNP). The two estimates are based on largely independent sources and methods (see table 8 and accompanying discussion). The components of the two estimates are subject to a variety of measurement errors, which are reflected in the statistical discrepancy. Two points illustrate why these errors cannot be taken as a measure of the underground economy. First, not only the income side, but also the product side, is derived in part from tax return information and, further, both sides incorporate adjustments designed to remove the effects of underreporting of income on tax returns. Second, for some components, including some where misreporting related to the undeground economy may well occur, the same estimates appear on both the income and product sides. For example, the same estimate of wages and salaries of domestic workers appears both on the income side in employee compensation and on the product side in personal consumption expenditures. Thus, the NIPA statistical discrepancy does not reflect some major income-expenditure differences that would qualify it as a measure of the underground economy.

## Effect of the underground economy on NIPA estimates

Part III, in discussing misstatement of economic statistics due to the underground economy, concluded with the statement that the various sets of economic statistics-employment and unemployment, prices, national income and product, and so on-are affected differently because of differ-

[^27]ences in their scope and in the sources and methods used to prepare them. A review of the scope of the NIPA's and an evaluation of their sources and methods were promised in this part. The major point with regard to the scope of the NIPA's was already made: They do not intend to cover the illegal underground economy. Thus, it cannot be said that the NIPA's "miss" the illegal underground economy or are understated because of it. What remains is to evaluate sources and methods.

The availability and quality of data-source data together with what might be called evaluative and supplementary data-basically determine how well the economic accountant can cope with the underground economy. This section focuses on the data underlying GNP, the most commonly used measure of U.S. production, and its income-based counterpart. The preliminary revised estimates for 1977 are reviewed in order to bring into consideration the improved adjustments for taxpayer misreporting incorporated in those estimates. ${ }^{31}$ It should be emphasized that the discussion is limited to the possible mismeasurement due to the underground economy; it does not extend to the several other possible causes of mismeasurement.

Table 7 shows, in its first column, a categorization of NIPA source data and, in its middle column, the main sources of each type. The overall framework of the categorization of source data is a common one: government sources, separated into administrative data and nonadministrative data, and trade and other private sources. The categorization then goes further to take into account other characteristics of particular interest in a discussion of the underground economy.

Within the category of tax information, tax return tabulations (both income and employment) and other information are shown separately to reflect the way they are used in estimating the NIPA's. Income and employment tax return tabulations are used in estimating income and prod-

[^28]uct components that need to be adjusted for taxpayer misreporting to bring them up to actual levels, and the other tax return information is used in estimating components-specifically government receipts-that do not need to be adjusted because they are already at actual levels. Regulatory agency reports are tabulations of information filed by financial, transportation, utility, and a few other kinds of firms in compliance with Federal regulations. A third kind of government administrative data consists of reports of agencies that administer specific programs (such as Social Security), Federal budget documents, censuses and surveys of State and local government (other than as sources of tax information), and import forms and export declarations.

Nonadministrative government data-that is, data collected by government for statistical purposes-are shown in three categories. The economic censuses are quinquennial collections of data across a wide spectrum of U.S. industry. Other censuses and Government surveys are separated into household and nonhousehold. In general, fewer cross-checks are available for responses in household surveys, so that the potential of concealment or other misreporting is larger.

Trade and other private sourcesfor example, trade associations-provide information about life insurance, expenditures on natural gas and electricity, and a few other items. The "other" category, as the name suggests, is diverse. The most important are the BEA capital stock data (that are themselves the result of complex estimating procedures).

A commonsense approach underlies the comments in the last column of table 7 about possible misreporting due to the underground economy. With a list of underground activi-ties-such as the one that began this article-as a guide, the source data were examined to identify those that might be affected. As is clear from the comments, NIPA source data vary substantially in this respect. An asterisk preceding a comment indicates possible or, in some cases, likely misreporting. The elaborations of the asterisked comments that follow describe briefly the way the source data are used in preparing the NIPA's and highlight features of the source data that may have bearing on their sus-

Table 7.-The Underground Economy and NIPA Source Data

| Source date |  | Comments about possible misreporting due to the underground economy. Asterisk indicates possible or likely misreporting; see text |
| :---: | :---: | :---: |
| Type | Main sources ${ }^{1}$ |  |
| A. Tax information: income and employment tax return tabulations | For Federal income taxes, tabulations of business and individual returns in Statistics of Income, and for employment taxes, tabulations of returns filed by employers with State Employment Security Agencies. | *Income and expense items used to estimate the NIPA's are misreported; BEA makes adjustments to bring NIPA income estimates up to actual levels. ${ }^{2}$ See comments on economic censuses. |
| B. Tax information: other | Monthly Treasury Statement, Budget of the United States, and data (via the Census Bureau) from State and local governments. | NIPA tax components should be actual levels (although the "actuals" are less than if there were no underground economy). As reported, taxes are "actuals," so that use of this information does not lead to misstatement of NIPA tax components. |
| C. Regulatory agency reports | Reports of Federal Deposit Insurance Corporation, Federal Home Loan Bank Board, and Interstate Commerce Commission. | Data are not likely to be misreported. Typically, the reporting unit is a firm whose legal form, size, and line of business are not conducive to underground activities. |
| D. Other government administrative reports | Export declarations and import forms, Monthly Treasury Statement and Budget of the United States, reports of agencies administering specific programs, and data (via Census Bureau) from State and local governments. | ${ }^{*}$ Export declarations and import forms are likely to miss some shipments. Data from agencies, administering transfer payments and subsidies are "actuals" (although the "actuals" are more than if there were no underground economy). Data on compensation of government employees and other purchases are not likely to be misreported. |
| E. Economic censuses | Censuses of retail trade, wholesale trade, service industries, mineral industries, and manufactures. | *Sales are misreported because tax return information is used by the Census Bureau; BEA makes adjustments to bring NIPA product estimates up to "actuals." ${ }^{2}$ However, sales are likely to be misreported for other reasons. |
| F. Other censuses and Government surveys: household | Current population survey, census and survey of housing, survey of residential alterations and repairs, and consumer expenditure survey. | *The number of domestic workers in the current population survey is likely to be misreported. *Renting of living quarters in owner-occupied houses may be misreported in the census and survey of housing. "Expenditures on residential repairs and alterations are likely to be misreported. |
| G. Other censuses and Government surveys: nonhousehold ${ }^{3}$ | Value of new construction put in place, census of agriculture and surveys of farm production and expenses, surveys of direct investment in the United States and abroad, and surveys of investment other than direct investment in the United States and abroad. | *The number of building permits and permit value, from which the put-in-place value for single-unit housing is derived, may be misreported. 'Farmers' direct sales to consumers may be misreported. Rest-of-the-world direct investment income is not likely to be misreported, because the reporting unit is a firm whose legal form, size, and line of business are not conducive to underground activities. *Rest-of-the-world income from investment other than direct investment is likely to be misreported. |
| H. Trade and other private sources | Best's Aggregates and Averages, and reports of the American Council of Life Insurance, American Gas Association, and Edison Electric Institute. | Data are not likely to be misreported. Typically, the reporting unit has a legal form, size, and line of activity that are not conducive to underground activities. |
| I. Other | Percentage of sales for tips, and capital stock calculations. | *Sales, on which tips are calculated, are misreported. Estimates based on capital stock calculations are not likely to be sensitive to underground activities. |

Note.-The sources and comments refer to the preliminary revised estimates for 1977; see Don-
thoe

3. Censuses and surveys of State and local governments are in categories B and D.
ceptibility to misreporting due to the underground economy.
Income and employment tax return information.-Information from income and employment tax returns enters the NIPA's both directly, via its use to prepare estimates of a number of NIPA income components, and indirectly, via its use by the Census Bureau in the economic censuses (see the discussion of the economic censuses). As noted earlier, BEA prepared an improved set of adjustments to correct the NIPA estimates for the effects of taxpayer misreporting and incorporated them into the input-output table and preliminary revised NIPA estimates for 1977 (see Parker ${ }^{\circ}$ ). The adjustments were based on new information about the extent of failure to file tax returns and of inaccurate reporting. Adjustments were for seven income components: wages and salaries, nonfarm proprietors' income, rental income of persons, corporate profits before tax, net interest, capital consumption allowances, and the capital consumption adjustment. These adjustments
summed to $\$ 81.5$ billion in 1977. For other income components derived from tax return information, either the new information indicated that adjustments were not needed or information was not available on which to base an adjustment.
The adjustments do not distinguish between misreporting due to taxpayers' errors and misinterpretation, and that related to various forms of tax evasion-working off the books, skimming, and similar activities-associated with the underground economy. Clearly, however, most misreporting, and thus adjustments for it, relate to the underground economy. Specifically , the adjustments relate to the part of the underground that gives rise to legal-source income; they do not attempt to correct for laundered illegal incomes that are unintentionally included in the NIPA estimates derived from tax return information.
Because the adjustments are based on information that is incomplete and, in some cases, of questionable quality, they are subject to substantial error. In the aggregate, however,
it appears that the adjustments made to the NIPA income components are as likely to be overstated as understated.

Export declarations and import forms.-Exports and imports are estimated by BEA as part of the U.S. international transactions (balance of payments) accounts. These estimates are incorporated, after adjustment for coverage differences, into the NIPA's. Exports and imports of goods are derived primarily from Census Bureau compilations.

The compilation of exports is of information reported on shippers' export declarations required to be filed with customs officials for shipments leaving the United States. These declarations are compiled for all shipments, except those to Canada, valued over a fixed, low amount. Lowvalue shipments, which are less than 1 percent of the total, are estimated by the Census Bureau. For shipments to Canada, a probability sample of shipments valued at more than the fixed amount, but below $\$ 1,999$, is used, and for shipments valued at
$\$ 2,000$ or more, declarations are compiled. BEA makes adjustments to the Census data to obtain fuller coverage on the basis of reconciliations with Canadian import information. For imports, the compilation is of information reported on various import forms required to be filed with customs officials for shipments coming into the United States. The import forms are compiled for all shipments valued over a fixed, low amount. These shipments are subject to examination for customs appraisal; in the course of the appraisals, customs officials verify the reported information, which includes value and commodity classification. Low-value shipments, which are less than 1 percent of the total, are estimated by the Census Bureau.

For imports of legal goods, evasion of customs duties is the major reason for smuggling-boardly defined to include importing without an import form or with a form that underreports value. (Goods for which production is illegal-for example, drugsprobably account for most of the value of smuggling. Of course, such goods are not, in concept, included in GNP.) To the extent that this evasion and similar actions occur, NIPA imports are too low, and thus net exports overstated, due to the underground economy. However, for goods for which the commodity flow procedure is used to estimate sales to consumers and to business for investment in equipment, that procedure (as described in the section on economic censuses) adds the value of imports to the value of industry sales to derive the value to be distributed among these purchasers. Accordingly, these components of GNP would be understated by the amount that imports are too low. Thus, GNP would not be affected by the smuggling. Such goods probably are a large portion of the goods imported without forms or with forms that underreport value. For other goods, there are several possible effects on GNP; GNP could not be understated due to the smuggling of these goods, and may be overstated.

For exports, circumventing embargoes or other restrictions-such as on certain high-technology shipments to selected countries-is the major reason to export legal goods without a declaration or with a declaration that misreports the commodity classification. To the extent that goods are ex-
ported without declaration for such reasons, NIPA exports, and thus net exports, are understated due to the underground economy. For a large portion of goods that would be involved, the commodity flow procedure is used to estimate other GNP components. The offset in GNP that is the result of this procedure is not complete; the amount of the trade and transportation margins on the exports may be missed. Misreporting of commodity classification, to the extent that it is associated with undervaluation, would have similar effects. For the-probably very small-amount of other goods, exports and GNP are understated. (As in the case of imports, illegal goods are not, in concept, included in GNP.)

Economic censuses.-For the years of the economic censuses (years ending with 2 and 7), NIPA estimates for the bulk of personal consumption expenditures and of producers' durable equipment and for mobile homes are derived from sales data from the Census Bureau's economic censuses. (The term "sales" refers not only to the sales items published in reports of the censuses of wholesale and retail trade, but also shipments for mining and manufacturing and receipts for service industries.) Within an inputoutput framework, the sales are used in a generalization of the procedure long known as "commodity flow." This procedure starts with industry sales, adds imports and subtracts exports, adds inventory change, separates from the rest that destined wholly or in part to be purchased by persons or by business for investment, and adds transportation and trade margins (including taxes) to derive the NIPA estimates.

By congressional authority, firms must provide the information requested in the economic censuses, and the Census Bureau must protect the confidentiality of the information. The 1977 Census of Manufactures provides an example of these censuses. It covered a universe of 300,000 manufacturing firms. Complete enumeration was obtained from about 155,000 . Data on labor, materials, and capital input; output, for about 13,000 separate products; location; and legal form of organization were collected by mail questionnaire and by telephone followup. Administrative records-including tax return information-were used to make estimates for about

145,000 small, single-plant firms (generally those with fewer than 10 employees).

Table 7 identifies two possible kinds of misreporting in the sales data from the economic censuses that are used to derive NIPA estimates. First, sales may be understated because tax return information is used by the Census Bureau to define the universe and, as just mentioned in the case of the census of manufactures, to provide data on small firms that are not sent a census report form. Adjustments were introduced in the NIPA product estimates for 1977 to correct for this understatement. In the aggregate, it appears that the adjustments made to GNP are as likely to be overstated as understated (see Parker ${ }^{\circ}$ ).

Second, for firms that return a census report form, sales might reflect skimming, reporting lower sales to show a profit margin consistent with employing workers off the books, and similar actions. However, there is little evidence of misreporting by these firms in the censuses. For small firms, the Census Bureau found that sales reported in the censuses were substantially higher than those reported by the same firms on their tax returns, and for large firms, even tax returns were found to contain only very slight misreporting of sales. ${ }^{32}$ Nevertheless, a small amount of understatement of sales is likely. The effect on NIPA product components depends on the industries in which the misreporting occurs, but it is less than the full amount of misreported sales. In manufacturing and mining, it is the amount of misreported sales of products destined to be sold to persons and business for investment; for trade, it is the margin on misreported sales; and for services, the amount of misreported sales to persons. ${ }^{33}$

Current population survey.-For wages and salaries of domestic workers (and the counterentry in personal consumption expenditures), NIPA estimates are prepared by using the

[^29] sales.
number of such workers and average weekly hours to obtain total manhours and then multiplying manhours by average hourly earnings. This information is from the Census Bureau's current population survey.

The current population survey is a nationwide monthly sample survey that provides a large amount of detail on the economic status and activities of the civilian noninstitutional population. It is a multistage probability sample of about 72,000 households (in 1981). A rotation sample system is used, in which households are in the sample 4 months, out for 8 months, and in for 4 more. Personal interviews are conducted for the first and fifth months a household is in the sample, and telephone interviews are conducted in others. The respondent is asked a series of structured questions about the economic activity, during the preceding week, of each civilian member of the household 14 years and older. The primary purpose of the questions is to classify the sample population into three basic groups-employed, unemployed, and not in the labor force.

Domestic work is among the occupations most likely to include persons who work off the books or without permits if they are aliens. Concealing employment in their responses to the current population survey would reflect concern that, despite assurances that the information is only for statistical purposes, the responses will be turned over to tax, social security, or immigration authorities. To the unknown extent that respondents engage in this and similar underground activities, the number of domestic workers is underreported in the survey, and the understatement carries through to the two NIPA estimates.

Census of housing and American housing survey.-The basic approach in estimating rental income from, and rent on, nonfarm housing in the NIPA's is to multiply the number of occupied units by an average rent. The two estimates are part of rental income of persons and personal consumption expenditures, respectively. For years of the decennial census of housing, information is available on the number of occupied units, separately for owner- and tenant-occupied, and on mean contract rent of rented properties, arrayed by market value. The mean contract rent of owner-oc-
cupied units is imputed on the basis of the rent charged for tenant-occupied units of the same market value. Estimates of items included in the contract rent other than living space-for example, utilities-are subtracted to arrive at "space" rent, that is, the rent of the housing unit itself. These space-rent estimates appear in personal consumption expenditures. Expenses associated with ownership of housing units-for example, maintenance and repairs, which is discussed next-are subtracted to derive rental income. For other years, information on the number of units and mean contract rent from the American housing survey (previously called the annual housing survey) is used to extrapolate the estimates based on the census of housing.

The census of housing uses mail questionnaires and personal interviews, and the biennial survey, a multistage probability sample, uses personal interviews to determine characteristics of occupied and vacant housing units. The characteristics include owner- or renter-occcupied units in the structure, age of structure, number of rooms, persons per unit, equipment and facilities, value of units, and rent of tenant units. The census and survey also include questions about household characteristics; some questions are about income, including rental income.

In answering questions in the census or survey, owner-occupants may conceal that they rent living quarters to others to maintain consistency with misreporting on income tax returns or out of concern that responses will be turned over to local jurisdictions that may restrict or regulate such rentals. To the extent that these or similar actions occur, imputed rent and rental income of owneroccupiers, rather than tenants, would be associated with the covertly rented space. Thus, the split of total rental income and of total rent between owner-occupiers and tenants would be misstated, but the totals, and also the income and product totals, would not be affected.

Consumer expenditure survey and survey of residential alterations and repairs.-In the NIPA's, residential additions and alterations are part of the residential investment component of GNP, and the expense of maintenance and repairs is deducted in calculating the residential nonfarm
rental income component of rental income of persons. The estimates are derived for owner-occupied units from the Bureau of Labor Statistics consumer expenditure survey (see Donahoe ${ }^{\circ}$ ) and for tenant-occupied units from the Census Bureau survey of residential alterations and repairs.
The consumer expenditure survey is a nationwide probability survey designed to collect expenditures and income. It has two parts: an interview survey and a diary survey. In the interivew survey, which is the source of data on residential repairs and alterations, consumer units-families, financially independent persons, and groups of persons who pool their income and make joint expenditure decisions-are interviewed every 3 months over a 12 - or 15 -month period. In the 1972-73 survey, 11,500 were sampled, in the $1980-81,5,000$. The data collected include not only detailed expenditures, but also income, work experience, and changes in assets and liabilities.

The portion of the survey of residential repairs and alterations that is used is based on a questionnaire mailed to nonresident owners of rental or vacant properties. ${ }^{34}$ The description of the survey notes that it is more likely that records are kept of expenditures for upkeep and property improvement for large rental properties than for properties with a single unit or a small number of units. The survey form does not include questions designed to aid recall, because it is designed to be completed by respondents after consultation with their records.

To the unknown extent that respondents to the consumer expenditure survey conceal expenditures made to off-the-books workers and other "informal suppliers," conceal expenditures that add to the value of their house to avoid increased tax assessment, or take similar actions, these expenditures are understated due to the underground economy.

[^30]Residential investment, and thus GNP, would be understated; rental income of persons, and thus charges against GNP, would be overstated. Concealment by respondents to the survey of residential repairs and alterations is also likely, but probably less so. Respondents' size (mainly owners of larger units) and legal form (some corporations) are not conducive to concealment.

Construction put in place.-Construction of new one-unit housing in the NIPA's is derived from the Census Bureau series on the value of construction put in place. That series, in turn, is based on data from surveys of housing starts and building permits. Total put-in-place value is obtained by multiplying the number of units started by an average cost per unit and distributing the product over time by applying fixed monthly progress rates.
The number of units started is compiled in several steps. (1) The number of units for which building permits are issued is compiled annually for the jurisdictions that require building permits and is estimated monthly on the basis of a sample of those jurisdictions. (2) The rate at which permit-authorized buildings are started is estimated on the basis of a sample of permit-issuing jurisdictions, and that rate is applied to the number of permits issued to obtain the number of units started. (3) The number of starts is adjusted upward; one adjustment is 3.3 percent to account for units started without a permit within permit-issuing jurisdictions. (4) An estimate of the number of units started in jurisdictions that do not issue permits is added. The estimate for the jurisdictions that do not issue permits, which now account for about 8 percent of housing starts, is based on interviews of knowledgeable persons and canvases of sampled land areas.

The average cost is also estimated separately for permit-issuing and other jurisdictions. For permit-issuing jurisdictions, the average permit value, based on the number and value of permits authorized, is increased 13.9 percent to account for undervaluations and 3.7 percent to account for architectural and engineering fees.

Both the number of permits and permit value may be affected by underground activities similar to those mentioned for additions and alterations. The 3.3 -percent upward adjust-
ment for units built without a permit within permit-issuing jurisdictions is based on a survey conducted in the early 1960 's. To the extent that increased incentives to conceal construction have not been offset by other factors (such as fewer hard-tomonitor rural building sites, fewer houses constructed without a general contractor, or increased enforcement activity), this adjustment would be understated. The Census Bureau has identified some understatement in the 13.9-percent upward adjustment for undervaluation, which is based on a survey in 1956. For the preliminary revised estimates for 1977, BEA increased the average value of new oneunit houses by 5 percent (see Donahoe ${ }^{\circ}$ ). The Census Bureau expects to introduce a similar revision in their series.) Some undervaluation of oneunit housing-possibly due to the underground economy-may remain, and to that extent GNP is understated.

Census of agriculture and other reports on farm production.-The NIPA estimate of personal consumption expenditures for food includes an amount for food sold directly to consumers by farmers. Receipts from such sales are part of farm proprietors' income. These estimates, which are from the Department of Agriculture, are based on data from the census of agriculture and from other reports on crop production by the Department of Agriculture.

The census of agriculture is, in several respects, like the economic censuses: It is conducted by the Census Bureau, usually quinquennially; reporting is required, and confidentiality is protected by law. Data are collected, by mail questionnaire with personal and telephone followup, on acreage, crops and livestock, equipment, farm sales, selected expenses, and other items. In the other reports on crop production, quantity and price data for vegetables and fruitswhich are the food crops that seem most likely to be sold under conditions that reflect underground activi-ties-are collected from growers, shippers, marketing associations, and other knowledgeable sources. Personal contact is supplemented by mail surveys and telephone followups. For fruits, probability surveys are also used. The data collected in these ways are checked against other data-for
example, on crop movements and inspections.
The Department of Agriculture attempts to take into account sales that are related to the underground economy. Information is provided in part by surveys and other work done under the 1976 Farmer-to-Consumer-Direct-Marketing Act. One possibility is that missed sales of fruits and vegetables are misclassified as consumption on the farm. In this case, the estimates of total (including imputed) expenditures on food and of farm proprietors' income would include the misclassified amounts, and the totals would not be affected. To the unknown extent that any missed sales are not misclassified in this way, the two NIPA estimates, and the income and product totals, are understated.
Rest-of-the-world investment other than direct investment.-Receipts and payments of income on investment other than direct investment are estimated as part of the U.S. international transactions (balance of payments) accounts. These estimates are incorporated into the NIPA's. These incomes are receipts and payments of interest on holdings of debt securities; interest on loans, deposits, and other claims; and dividends on holdings of equity securities. Receipts and payments are part of exports and imports of services, respectively, in GNP, and net receipts are parts of interest and corporate profits in charges against GNP.
The estimates for securities are prepared by adjusting a base-period level for subsequent changes in receipts and payments. The base-period levels are from U.S. Treasury reports: a 1943 census of American-owned assets in foreign countries, and surveys of portfolio investment in the United States (the latest in 1978). The changes in receipts and payments are estimated by applying dividend and interest rates to subsequent transactions in securities. Estimates for the remaining components are prepared by applying yields to the amounts of bank and nonbank assets and liabilities outstanding in a given period (with time lags when appropriate). Information on transactions in securities and on outstanding assets and liabilities are from Treasury forms required of banks, security brokers and dealers, and nonbanking concerns for transactions over fixed amounts.
For these components, it is particularly difficult to separate general defi-
ciencies in the data from deficiencies that stem from misreporting due to the underground economy. However, two aspects of misreporting seem reasonably clear. First, to the extent that foreign intermediaries are used by U.S. residents to conceal their income, receipts would be underreported, and payments would be overreported. Second, to the extent that U.S. intermediaries are used by foreign residents to conceal their income from their governments, payments would be underreported. The two effects on payments tend to offset each other. Net exports of services, and thus GNP, and net receipts of interest and dividends, and thus charges against GNP, are understated by the amount of underreported receipts.

Percentage of sales for tips.-In the NIPA's, separate estimates of tips are made for industries in which they are likely to be significant amountsmainly eating and drinking places; hotels and other lodging places; amusements; personal services, such as barber and beauty shops; and taxicab transportation. They are estimated as a percentage of the relevant sales. This method is used because it has long been recognized that self-reporting of tips earned was not likely to be complete and that employers are required to report on employment tax returns only tips collected by and paid to the employee by the employer. The estimate derived in this way is added to wages and salaries. The assumption underlying the addition of this amount is that no tips are reported in the employment tax return information used to estimate wages and salaries. The portion that is paid by persons is added to personal consumption expenditures.

The percentages used are largely judgmental estimates based on information about tipping practices. Although perhaps too low, they do not appear to be suspect for reasons related to the underground economy. The sales data are largely from the economic censuses, but were not adjusted for the understatement described earlier before the tips calculations were made. For this reason, the estimates of tips are likely to be understated. The full amount of understatement would affect wages and salaries, and thus charges against GNP. Less than the full amount would affect personal consumption expenditures, and thus

1. Preliminary revised estimates.
2. The $\$ 80.6$ billion of personal consumption expenditures and gross private domestic investment that is based indirectly on tax return information is included with economic censuses.

GNP. However, to the unknown extent that the assumption about nonreporting of tips on employment tax returns is incorrect, the income totals contain double-counted tips; the amount of double count would tend to offset the understatement.
Effect on GNP and charges against GNP.-Table 8 shows distributions of GNP and of charges against GNP for 1977 by type of source data, using the categorization presented earlier. It is derived from a detailed presentation in the appendix of the major components of GNP and of charges against GNP broken into subcomponents by type of source data. (The appendix shows, for example, that the subcomponents of wages and salaries are derived from employment tax return information; reports of regulatory agencies; other government administrative reports; censuses and Government surveys, both household and nonhousehold; and other data.) Within each type of source data, components that were identified as derived from
source data possibly misreported due to the underground economy in a way that would affect the production totals (hereafter referred to as the identified components) are shown on separate lines. (Components for which the misreporting did not affect the production totals are not shown separately, and are not carried further in the evaluation.) This table is the basis for several conclusions that help answer the following question: To what extent are these measures of economic activity likely to be understated because they miss the underground economy?
First, over one-half of GNP is derived from economic censuses and over one-half of charges against GNP is derived from income and employment tax returns. BEA has made adjustments for taxpayer misreporting in both. Data were not available to make adjustments for a few components, or parts of components, that were identified as needing them. BEA concludes from the evaluative infor-

Table 9.-Sensitivity of GNP and Charges Against GNP to Misstatement of Identified Components

1. Assumed understatement of 5 percent; see text.
 table, negative understatement) of rental income.
mation now available that the adjustments that were made, in the aggregate, are as likely to be overstated as understated. For charges against GNP, the omitted adjustments probably lead to overstatement of the adjustments and, thus, of charges against GNP. For GNP, the omitted adjustments lead to understatement to the extent-probably quite smallthat corporations fail to file tax returns. Further, as mentioned earlier, it is likely that, because respondent firms in the economic censuses understate their sales, GNP is understated to a small extent. Overall, however, it seems fairly safe to conclude that, with the improved adjustments in place, there is no evidence that clearly indicates more than quite small understatement due to the underground economy for about 51 percent of GNP (line 8) and for 56 percent of charges against GNP (line 23).

Second, substantial parts of GNP and of charges against GNP are derived from source data that are not likely to lead to understatement due to the underground economy. To begin with, 7 percent of GNP (lines 3 , 4 , and 18) and 16 percent of charges against GNP (lines 24, 25, and 36) are derived from the two kinds of sources-regulatory agency reports and trade sources-that are not likely to be misreported, and from other tax information, which does not cause mismeasurement of the NIPA's.

The remaining types of source data-other government administrative reports; other censuses and surveys, both household and nonhousehold; and other-were the ones in which some of the specific sources were identified as being subject to misreporting. In table 8, the NIPA components derived from these specific sources are shown separately within each category of source data, and a residual "other" entry is shown. For these "other" entries and for the whole category if no separate NIPA component is identified, the NIPA estimates derived from them are probably not misstated due to the underground economy. Thus, for GNP and for charges against GNP, respectively, an additional 31 percent (lines 7, 12, 17, and 21) and 25 percent (lines $26,31,35$, and 39 ) are in components that probably are not mismeasured due to the underground economy in a way that affects the production totals.
Third, and last, 11 percent of GNP and 3 percent of charges against GNP are in components that may be, or are likely to be, mismeasured due to the underground economy in a way that affects the production totals. For GNP, these components are exports of goods, due to missed margins and shipments (line 6); purchases of services of domestic workers, due to undercount of these workers (line 10); residential additions and alterations, due to underreporting in the surveys
(line 11); construction of one-unit housing, due to underreporting of the number and value of building permits (line 14); direct sales of food to consumers by farmers (line 15); rest-of-the-world receipts of income on nondirect investment, due to concealed income of U.S. residents (line 16); and tips, due to the misreporting of sales on which they are calculated (line 20). For charges against GNP, these components are wages and salaries of domestic workers (line 29); rental income of persons on nonfarm residential properties (a negative effect, because repairs and maintenance, which are deducted to obtain net income, may be underreported) (line 30); farm proprietors' income, reflecting the underreporting of direct sales of food to consumers (line 33); rest-of-the-world receipts of income on nondirect investment (line 34); and tips (line 38).
Very rough tests of the sensitivity of GNP and of charges against GNP to misreporting in these identified components can be done by assuming percentages by which these components are understated due to the underground economy. Such tests are rough because they do not take into account that in some cases the misreporting is more likely than in others, nor do they generally take into account that in some cases the likely misreporting is substantial and in others only slight. With one exception
(for exports of goods), the results of assuming across-the-board 5 -, 10 -, and 50 -percent understatment for these components are shown in table 9. For exports of goods, only the 5 -percent understatement is included in the table because the inclusion of the 10 and 50 -percent understatement would not give reasonable results. The amount of understatement in exports of goods-possibly the trade and transportation margins on misreported exports of consumer and investment goods, plus misreported other goods-can only be quite small in comparison to the value of these exports, which, at $\$ 122.5$ billion, is far larger than that of the other components shown.

In BEA's judgment, 50 percent across-the-board is far too high; it sets an extreme outer limit. Even if 50 percent is assumed, GNP would be too low by $\$ 57$ billion, or about 3 percent, as a result of the effect of the underground economy on these components. ${ }^{35}$

The "understatement" columns, along with the fact that $\$ 20$ billion is 1 percent of GNP in 1977, provide the information with which to make quick alternative calculations that are not so extreme. For example, one might assume understatement of 5 percent for exports of goods ( $\$ 6.1$ bil-
35. Another way to evaluate the amount of understatement in GNP is to calculate its impact on the growth rate. This calculation can be made as follows: (1) Assume a base year, i.e., a year in which there was no understatement in GNP; (2) calculate average annual growth rates from GNP in the base year to GNP in 1977, as measured and as measured plus the amount of understatement; and (3) find the difference between the two growth rates.
lion); 20 percent for domestics' services ( $\$ 1.2$ billion); 10 percent each for residential additions and alterations ( $\$ 1.6$ billion), for construction of 1 -unit housing ( $\$ 5.7$ billion), and for food sold directly to consumers by farmers ( $\$ 0.9$ billion); 30 percent for rest-of-the-world receipts of income on nondirect investment ( $\$ 3.3$ billion); and 50 percent for tips ( $\$ 1.3$ billion). ${ }^{36}$ These assumptions give about $\$ 20$ billion, and allowing another $\$ 10$ billion for other understatement would put the total at about 1.5 percent of GNP.

The amounts shown for charges against GNP are much smaller than those for GNP. A result such as this is not unreasonable because, as is clear from table 8 (and even clearer from the appendix), the two production measures are derived from quite different mixes of sources.

Summary and conclusion.-This section, by a review of NIPA source data, grappled with the difficult question: To what extent are GNP and charges against GNP understated because they miss the underground economy? It first summarized BEA's work on improved adjustments to correct for a major effect of the underground economy on the NIPA's-taxpayer misreporting in tax return information used directly and indirectly in estimating them. On the basis of the evaluative information available, BEA has concluded that the improved

[^31]adjustments, now complete only for 1977, are as likely to be overstated as understated. Thus, there is no clear evidence of more than a quite small understatement in components that make up over one-half of GNP. Next, it identified the components that are susceptible to understatement because of misreporting due to the underground economy in other source data. It was shown that even if 50 -percent understatement is assumed for these components, an assumption that in BEA's judgment is an extreme outer limit, GNP would be understated by only 3 percent because of them.

This evaluation of possible understatement of GNP due to the underground economy was for the preliminary revised estimates for 1977. BEA will extend the taxpayer misreporting adjustments forward and backward. The information with which to do this is much less complete than that available for 1977, so that it will not be possible to make the adjustments for other years with the same degree of confidence. Of course, the quality of the adjustments is very important to the evaluation of GNP, because they apply to such a large part of GNP. In the next few years, as in the last 5 years or so, BEA and other agencies will continue to study the effects of the underground economy on source data, because it is clear that there is much to learn. BEA's work on measuring illegal activities in a NIPA framework is but one specific area where work is underway. These efforts not only will provide better information on the underground, but also will improve the NIPA's.

${ }^{P}$ Preliminary.

1. The personal income shown for the United States differs from that in the national income and product accounts primarily because it omits income received by Federal Government employees overseas.

Nore.-The quarterly estimates of State personal income were prepared by Francis G. McFaul with the aid of Thelma Harding, under the supervision of Robert L. Brown. The table was prepared by Eunice P. James and Kathy A. Albetski.

## INDISPENSABLE Economic Information

from the Bureau of Economic Analysis

The journal of record and research of the Bureau of Economic Analysis. Published monthly.

## BUSINESS

CONDITIONS DIGEST
The Wall Street Journal said it was "the single most useful government publication, in the opinion of many analysts." (March 21, 1977) Published monthly.

## FOOTNOTES FOR PAGES S-1 THROUGH S-32

## General Notes for all Pages:

r Revised.
p Preliminary.
e Estimated.
c Corrected.

## Page S-1

$\dagger$ Revised series. See Tables 2.6-2.9 in the July 1984 SURVEY for revised estimates for 1981-84.
$\ddagger$ Includes inventory valuation and capital consumption adjustments.
§ Monthly estimates equal the centered three-month average of personal saving as a percentage of the centered three-month moving average of disposable personal income.

## Page S-2

1. Based on data not seasonally adjusted.
\# Includes data not shown separately.
本 See note " $\ddagger$ " for p. S-8.
$\dagger$ See note " $\dagger$ " for p. S-8.
$\dagger \dagger$ See note " $\dagger \dagger$ " for p. S-3.
@ Revised series. For manufacturing see note " $\dagger \dagger$ " for p. S-3. For retail see note " $\ddagger$ " for p. S-8. For wholesale see note "f" for p.S-8.

Page S-3
\# Includes data for items not shown separately.
$\ddagger$ See note " $\ddagger$ " for p. S-8.
$\dagger$ See note " $\dagger$ " for p. S-8.
$\dagger \dagger$ Effective May 1984 SURVEY, data have been revised for Jan. 1977-Dec. 1983. A detailed description of this revision and data appear in the report "Manufacturers' Shipments, Inventories, and Orders" M3-1.13 (1977-1983), copies of this report can be purchased from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. A computer tape of the report, including data back to 1958 can be purchased from the Data User Services Division, Customer Services Branch, Bureau of the Census, Washington, DC 20233.
@ See note "@" for p. S-2.

## Page S-4

1. Based on data not seasonally adjusted.
\# Includes data for items not shown separately.
$\ddagger$ Includes textile mill products, leather and products, paper and allied products, and printing and publishing industries; unfilled orders for other nondurable goods industries are zero.
$\dagger$ See note " $\dagger \dagger$ " for $\mathrm{p} . \mathrm{S}-3$.
$\diamond$ For these industries (food and kindred products, tobacco, apparel and other textile products, petroleum and coal, chemicals and allied products, and rubber and plastics products) sales are considered equal to new orders.

## Page S-5

1. Based on unadjusted data.
2. Series will resume when Dun \& Bradstreet has completed revising data processing procedures.
@ Compiled by Dun \& Bradstreet, Inc.
\# Includes data for items not shown separately.
§ Ratio of prices received to prices paid (parity index).
$\ddagger$ See note " $\ddagger$ " for p. S-4.
$\dagger$ Effective with the Feb. 1984 SURVEY, data (back to 1981 for some commodities) have been revised. Effective with July 1984 SURVEY, data for 1982-83 have been revised. These revisions are available upon request.
$\diamond$ Beginning with data for January 1983, the index is affected by a change in methodology used to compute the homeownership component. For additional information regarding this change, see p. S-36 of the Feb. 1983 SURVEY.

* New series.
$\dagger \dagger$ See note " $\dagger \dagger$ " for $\mathrm{p} . \mathrm{S}-3$.

## Page S-6

§ For actual producer prices or price indexes of individual commodities, see respective commodities in the Industry section beginning p. S-19. All indexes subject to revision four months after original publication.
\# Includes data for items not shown separately.

* New series. This index (first shown in the Feb. 1984 SURVEY) reflects costs associated with homeowners' consumption of shelter service. This new index combines the subindexes of owners' equivalent rent and household insurance. Indexes prior to Dec. 1982 are not available. For additional information, see p. S-36 of the Feb. 1983 SURVEY.
$\ddagger$ Effective with the Feb. 1984 SURVEY, data have been revised back to 1979 to reflect updated seasonal factors and are available upon request.
$\dagger$ Effective with the Feb. 1984 SURVEY, data back to 1979 have been revised and are available upon request.
$\diamond$ See note " $\delta$ " for $\mathrm{p} . \mathrm{S}-5$.

## Page S-7

1. Computed from cumulative valuation total
2. Index as of July 1, 1984: building, 357.9; construction, 387.9.
\# Includes data for items not shown separately.
§ Data for June, Sept., and Dec. 1983, and Mar. and May 1984 are for five weeks; other months four weeks.
$\dagger$ Data for seasonally adjusted housing starts have been revised from 1981-83, and are available upon request.
$\ddagger$ Data for seasonally adjusted building permits have been revised from Jan. 1982-Mar. 1984, and are available upon request.
(a) Unadjusted data for manufacturers' shipments of mobile homes for January 1982 through November 1983 and seasonally adjusted data for January 1981 through November 1983 have been revised and are available upon request.

## Page S-8

1. Advance Estimate.
2. Direct endorsement cases are included beginning with June data.
$\diamond$ Home mortgage rates (conventional first mortgages) are under money and interest rates on p. S-14.
§ Data include guaranteed direct loans sold.
\# Includes data for items not shown separately.
$\dagger$ Effective April 1984 SURVEY, wholesale trade data have been revised for Jan. 1978-Dec 1983. A detailed description and the revised series appear in the report "Revised Monthly Wholesale Trade" BW-13-83s, available from the Bureau of the Census, Washington, DC 20233; \$2.50 per copy.
$\ddagger$ Effective April 1984 SURVEY, retail trade data have been revised for Jan. 1978-Dec. 1983. Revised data and a summary of changes appear in the report "Revised Monthly Retail Sales and Inventories" BR-13-83s, available from the Bureau of the Census, Washington, DC 20233; $\$ 2.75$ per copy.

* New series. Annual data for earlier periods are available upon request. Monthly data for earlier periods will be available later.

## Page S-9

1. Advance estimate
\# Includes data for items not shown separately.
$\diamond$ Effective with the January 1984 SURVEY, the seasonally adjusted labor force series have been revised back to January 1979. Revised monthly series appear in the February 1984 issue of Employment and Earnings.
$\dagger$ The participation rate is the percent of the civilian noninstitutional population in the civilian labor force. The employment-population ratio is civilian employment as a percent of the civilian noninstitutional population, 16 years and over.
$\ddagger$ See note " $\ddagger$ " for p. S-8.

* New series.
(a) Data include resident armed forces.

## Page S-10

§ These unemployment rates are for civilian workers only. The unemployment rate for all workers, including the resident armed forces, was 7.0 in June 1984.
$\diamond$ See note " $\diamond$ " for p. S-9.

* New series.
$\dagger$ Effective June 1984 SURVEY, data have been revised back to April 1982 (not seasonally adjusted) and January 1979 (seasonally adjusted) based on the March 1983 benchmark, an improved method for estimating the employment effect of new firms entering the economy, and revised seasonal factors. The June 1984 issue of "Employment and Earnings" will contain a detailed discussion of the effects of the revisions.

## Page S-11

$\ddagger$ This series is not seasonally adjusted because the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision.
$\diamond$ Production and nonsupervisory workers.

* New series.
$\dagger$ See note " $\dagger$ " for p. S-10.

## Page S-12

1. This series is not seasonally adjusted because the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision. Use the corresponding unadjusted series.
$\diamond$ Production and nonsupervisory workers.
$\ddagger$ Earnings in 1977 dollars reflect changes in purchasing power since 1977 by dividing by Consumer Price Index.
§ Wages as of July 1, 1984: Common, \$15.79; Skilled, \$20.62.
${ }^{*}$ New series.
@ New series. The Employment Cost Index (ECI) is a quarterly measure of the average change in the cost of employing labor.
$\dagger$ Excludes farm, household, and Federal workers.
$\dagger \dagger$ See note " $\dagger$ "for $\mathrm{p} . \mathrm{S}$-10.

## Page S-13

1. Average for Dec
2. Reported annual; monthly revisions are not available.
3. Effective December 1, 1982, there was a break in the commercial paper series because of changes in reporting panels, modifications to reporting instructions and corrections to misreported bank data.
$\ddagger$ Effective January 1984, series revised due to changes in the reporting panel and in the item contents. The new panel includes 168 banks that had domestic office assets exceeding $\$ 1.4$ billion as of December 31, 1982.
\# Includes data for items not shown separately.
$\ddagger \ddagger$ Reflects offsetting changes in classification of deposits of thrift institutions. Deposits of thrifts were formerly grouped with deposits of individuals, partnerships, and corporations, instead of with deposits of commercial banks in the United States.

* "Transaction balances other than demand deposits" consists of ATS, NOW, super NOW, and telephone transfer accounts, which formerly were classified with savings deposits. "Nontransaction balances" reflects the combination of deposits formerly reported separately as time deposits and the savings deposits remaining after deduction of the items now reported separately under "transaction balances."
§ Excludes loans and federal funds transactions with domestic commercial banks and includes valuation reserves (individual loan items are shown gross; i.e., before deduction of valuation reserves).
$\diamond$ Securities of Federal agencies and corporations have been shifted out of "other securities" and are now combined with U.S. Treasury securities. Also, loan obligations of States and political subdivisions have been shifted out of "other securities" and are now shown separately among the loan items.
@ Insured unemployment (ali programs) data include claims filed under extended duration provisions of regular State laws; amounts paid under these programs are excluded from state benefits paid data.
@@ Insured unemployment as a percent of average covered employment in a 12 -month period.

## Page S-14

1. Data are for fiscal years ending Sept. 30 and include revisions not distributed to the months.
2. Average for the year.
3. Daily average.
4. Interest rate charged as of July 1, 1984 was 11.32.
$\dagger$ Effective April 1984 SURVEY, the consumer installment credit series have been revised back to July 1980 to reflect more complete benchmark data for some of the components.
\# Includes data for items not shown separately.
$\diamond$ Adjusted to exclude domestic commercial interbank loans and federal funds sold to domestic commercial banks.
$\ddagger$ Rates on the commercial paper placed for firms whose bond rating is Aa or the equivalent.
$\ddagger \ddagger$ Courtesy of Metals Week.
@ ${ }_{*}^{@}$ Average effective rate

* New series.

## Page S-15

1. Beginning 1983, the reporting frequency has been changed from a monthly to a quarterly basis.
2. This series has been discontinued.
$\dagger$ Effective Feb. 1984 SURVEY, the money stock measures and components have been revised back to 1959 and are available from the Banking Section of the Division of Research and Statistics at the Federal Reserve Board, Washington, D.C. 20551
$\ddagger$ Composition of the money stock measures is as follows:
MI.-This measure is currency plus demand deposits at commercial banks and interestearning checkable deposits at all depository institutions-namely NOW accounts, automatic transfer from savings (ATS) accounts, and credit union share draft balances-as well as a small amount of demand deposits at thrift institutions that cannot, using present data sources, be separated from interest-earning checkable deposits.
M2.-This measure adds to M1 overnight repurchase agreements (RP's) issued by commercial banks and certain overnight Eurodollars (those issued by Caribbean branches of member banks) held by U.S. nonbank residents, money market mutual fund shares, and savings and small-denomination time deposits (those issued in denominations of less than $\$ 100,000$ ) at all depository institutions. Depository institutions are commercial banks (including U.S. agencieps and branches of foreign banks, Edge Act corporations, and foreign investment companies), mutual savings banks, savings and loan associations, and credit unions.
M3.-This measure equals M2 plus large-denomination time deposits (those issued in denominations of $\$ 100,000$ or more) at all depository institutions (including negotiable CD's) plus term RP's issued by commercial banks and savings and loan associations.
$L$.-This broad measure of liquid assets equals M3 plus other liquid assets consisting of other Eurodollar holdings of U.S. nonbank residents, bankers acceptances, commercial paper, savings bonds, and marketable liquid Treasury obligations.
$\ddagger \ddagger$ Includes ATS and NOW balances at all depository institutions, credit union share draft balances, and demand deposits at thrift institutions.
$\diamond$ Overnight (and continuing contract) RP's are those issued by commercial banks to the nonbank public, and overnight Eurodollars are those issued by Caribbean branches of member banks to U.S. nonbank customers.

* New series. For "Other checkable deposits," see also note " $\ddagger \ddagger$ " for this page.
@ Small time deposits are those issued in amounts of less than $\$ 100,000$. Large time deposits are those issued in amounts of $\$ 100,000$ or more and are net of the holdings of domestic banks, thrift institutions, the U.S. Government, money market mutual funds, and foreign banks and official institutions.
\# Includes data for items not shown separately.
§ Number of issues represents number currently used; the change in number does not affect the continuity of the series.
@@ Annual data for 1978-82 and monthly data for 1982 have been revised to exclude private placements. Monthly revisions for 1978-81 are not available.

## Page S-16

1. The Aaa public utility average was suspended Jan. 17, 1984, because of a lack of appropriate issues. The 1984 ranges for the average corporate and Aaa corporate do not include Aaa utilities after January 16.
§ Number of issues represents number currently used; the change in number does not affect the continuity of the series.
$\ddagger$ For bonds due or callable in 10 years or more.
\# Includes data for items not shown separately.
(@) Data may not equal the sum of the geographic regions, or commodity groups and principal commodities, because of revisions to the totals not reflected in the component items.
$\diamond$ As of Jan. 25, 1984, the base period was changed to $1982=100$.

## Page S-17

1. Beginning with Jan. 1982 data, the Customs value is being substituted for the f.a.s. value.
\# Includes data not shown separately.
§ Data may not equal the sum of geographic regions, or commodity groups and principal commodities, because of revisions to the totals not reflected in the components.

## Page S-18

1. See note 1 for p. S-17.
2. Annual total; quarterly or monthly revisions are not available
3. Before extraordinary and prior period items.
4. For month shown.
5. Domestic trunk operations only (averaging about 90 percent of domestic total).
6. Restaurant sales index data represent hotels and motor hotels only.
\# Includes data for items not shown separately.
§ Total revenues, expenses, and income for all groups of carriers also reflect nonscheduled service.
$\ddagger$ Beginning Jan. 1977, Class I railroads are defined as those having operating revenues of $\$ 50$ million or more.
$\diamond$ Average daily rent per room occupied, not scheduled rates.
\#\# Data represent entries to a national park for recreational use of the park, its services, conveniences, and/or facilities.

* New series.

## Page S-19

1. Reported annual total; monthly revisions are not available.
2. A portion of data is being suppressed because of not meeting publication standards.
\# Includes data for items not shown separately.
§ Data are reported on the basis of 100 percent content of the specified material unless otherwise indicated.
$\ddagger$ Monthly data back to 1981 have been revised and are available upon request.

* New series, first shown in the Mar. 1984 SURVEY. Annual and monthly data back to 1980 are available upon request.

## Page S-20

1. Reported annual total; monthly or quarterly revisions are not available.
2. Annual total includes data for Hawaii; not distributed to the months.
§ Data are not wholly comparable from year to year because of changes from one classification to another.
$\ddagger$ Revised quarterly data for 1981 and 1982 are available upon request.
$\diamond$ Effective 1983, data are based on a new sample of approximately 150 establishments, which was selected using the 1981 annual survey "Paints and Allied Products" panel as a universe frame. Comparable data for 1979-82 are available upon request.
$\dagger$ Effective with the July 1984 SURVEY, data for 1980-82 (and 1975 for revenue from sales to customers) have been revised and are available upon request.

## Page S-21

1. Based on quotations for fewer than 12 months.
2. Crop estimate for the year.
3. Stocks as of June 1.
4. Stocks as of Junc 1 and represents previous year's crop; new crop not reported until June (beginning of new crop year).
5. Previous year's crop; new crop not reported until Oct. (beginning of new crop year).
6. See note "@" for this page.
7. Figure is preliminary and subject to change.
8. Quarterly estimates of rye stocks will no longer be available; however, June 1 stock estimates (representing previous year's crop) will continue to be published each year.
9. Effective with 1983, figure represents June 1. stocks (based on previous year's crop); whereas, 1982 and earlier annuals are for stocks ending Dec. 31 of the respective calendar year.
10. June 1 estimate of 1984 crop.
11. July 1 estimate of 1984 crop.
§ Excludes pearl barley.
\# Bags of 100 lbs.
@ Data are quarterly except for June (covering Apr. and May) and Sept. (covering June-Sept.).

* New series, first shown in the Mar. 1984 SURVEY. Annual and monthly data for earlier periods are available upon request.

4. For month shown.
$\dagger$ Beginning January 1982, data represent metallic (mostly aluminum) content. Data for 1981 and prior years represent aluminum content only.

Page S-26

1. Annual data; monthly revisions are not available.
2. Less than 50 tons
3. Quarterly data were discontinued for 1983 and reinstated beginning first quarter 1984
$\diamond$ Includes secondary smelters' lead stocks in refinery shapes and in copper-base scrap.
(@) All data (except annual production figures) reflect GSA remelted zinc and zinc purchased for direct shipment.
$\ddagger$ Source for monthly data: American Bureau of Metal Statistics. Source for annual data: Bureau of Mines.
\# Includes data not shown separately.
Page S-27
4. Data withheld to avoid disclosing information for individual companies.
5. Data are for five weeks; other months 4 weeks.
\# Includes data for items not shown separately.
§ Includes nonmarketable catalyst coke. See also note " $\ddagger$ " for this page.
$\diamond$ Includes small amounts of "other hydrocarbons and alcohol new supply (field production)," not shown separately.
$\dagger$ Effective with the Nov. 1983 SURVEY, data for 1982 have been revised. Effective with the June 1984 SURVEY, data for 1983 have been revised. These revisions are available upon request.

* New series. Includes U.S. produced and imported microwave ovens and combination microwave oven/ranges.
$\ddagger$ Effective with the July 1984 SURVEY, data for 1983 have been revised and are available upon request.

## Page S-28

1. Reported annual totals; revisions not allocated to the months.
2. Effective with Jan. 1983, data include road oil. Total road oil data for 1982 were (thous. bbl.): 591, domestic demand; 610, production; 47, stocks.
$\dagger$ New series. First shown in March 1984 SURVEY. Earlier data are available upon request.

* New series, first shown in the Feb. 1984 SURVEY. Prices back to 1974 are available upon request.
\# Includes data for items not shown separately.
$\ddagger$ Except for price data, see note " $\ddagger$ " for p. S-27.

Page S-29

1. See note 1 for p. S-28.
2. Average for 11 months; no price available for Dec. 1983.
$\diamond$ Source: American Paper Institute. Total U.S. estimated consumption by all newspaper users.
$\dagger$ See note " $\dagger$ " for p. S-28.

Page S-30

1. Reported annual total; revisions not allocated to the months.
2. Crop for the year.
3. Data cover five weeks; other months, four weeks.
\# Includes data for items not shown separately.
$\rangle$ Cumulative ginnings to the end of month indicated.
§ Bales of 480 lbs.
$\ddagger$ Beginning Jan. 1982, shipments include those for direct export; such shipments for 1981 were 2,165 thous. gross.
$\dagger$ Monthly revisions for 1981 and 1982 are available upon request.
@ Effective with the Mar. 1984 SURVEY, sales of regular basecoat and all other building plasters (including Keene's cement) have been combined to represent sales of total building plasters. For comparability, earlier published figures for these two series should be combined.

## Page S-31

1. Monthly data discontinued for the year 1982; reinstated beginning Jan. 1983.
2. Annual total includes revisions not distributed to the months.
3. Average for crop year; Aug. l-Jul. 31.
4. For five weeks; other months four weeks.
5. Average for 10 months; no data for Jan.-Feb.
6. Less than 500 bales.
7. Average for 9 months; no data for Oct.-Dec.
$\diamond$ Based on 480-lb. bales, preliminary price reflects sales as of the 15 th; revised price reflects total quantity purchased and dollars paid for the entire month (revised price includes discounts and premiums).
\# Includes data not shown separately.

* New series.

## Page S-32

1. Annual total includes revisions not distributed to the months.
2. Production of new vehicles (thous. of units) for June 1984: passenger cars, 683; trucks, 285.
3. Effective with the Feb. 1984 SURVEY, data have been revised back to 1981 to reflect updated seasonal factors and are available upon request.
4. Monthly data discontinued for the year 1982; reinstated beginning Jan. 1983.
5. Effective with the April 1984 SURVEY, data have been revised back to 4th Qtr. 1980 and are available upon request. Effective with the July 1984 SURVEY, the reporting of quarterly data has been discontinued; however, the related annual summaries will continue to be available from the Bureau of the Census.
6. Effective with the July 1984 SURVEY, data for 1980 and 1983 have been revised and are available upon request.
\# Total includes backlog for nonrelated products and services and basic research.
§ Domestics comprise all cars assembled in the U.S. and cars assembled in Canada and imported to the U.S. under the provisions of the Automotive Products Trade Act of 1965. Imports comprise all other cars.
$\diamond$ Courtesy of R.L. Polk \& Co.; republication prohibited. Because data for some states are not available, month-to-month comparisons are not strictly valid.
$\ddagger$ Excludes railroad-owned private refrigerator cars and private line cars.
$\dagger$ Monthly revisions for aircraft shipments and airframe weight for 1982 are available upon request. Monthly revisions for truck trailers, etc. for 1981 and 1982 are available upon request.
${ }_{*}^{(2)}$ Includes passenger vans.

* New series, first shown in the Mar. 1984 SURVEY. Annual and monthly data back to 1967 are available upon request.
$\dagger \dagger$ Includes Volkswagens produced in the U.S.

## The Prime Rate

The prime rate is the interest rate banks charge their most creditworthy business customers for short-term loans. It is the base used to scale upward the rates charged on most loans to other business customers. The prime rate is not as sensitive as money market instrument rates, which fluctuate daily in response to short-term changes in supply and demand. Rather, its movements tend to be infrequent, changing only by increments of one quarter of a percentage point. Major banks tend to change their prime rate in response to increasing differentials with selected open market money rates.

The data are monthly averages computed by multiplying each "predominant" prime rate (the rate charged by the majority of 30 large money market banks) by the number of days it was in effect during the month, summing these products, and dividing by the number of days in the month. The annual data are unweighted averages of the monthly averages.

For a discussion of the history of the prime rate and its role in the lending process, see "The Prime Rate," Monthly Review, Federal Reserve Bank of New York, April and May 1962, pp. 54-59 and 70-73, respectively.

Prime rate charged by banks on short-term business loans-present

|  | Jan. | Feb. | Mar. | Apr. | May | June | July | Aug. | Sept. | Oct. | Nov. | Dec. | Annual |

## In the second quarter

- Real GNP increased $71 / 2$ parcent
- Real final sales increased $101 / 2$ percent
- GNP fixed-weighted price index increased $31 / 2$ percent
- Real disposable personal income inereased 7 percent

Real GNP

GNP Fixed-Weighted Price Index

Real Final Sales

Real Disposable Personal Income

[^0]:    365 Prachiret H, N E $881 / 2000$

[^1]:    1. Quarterly estimates in the national income and product accounts are expressed at seasonally adjusted annual rates, and quarterly changes in them are differences between these rates. Quarter-to-quarter percent changes are annualized. Real, or constant-dollar, estimates are expressed in 1972 dollars.
    The "flash" (minus 15-day) estimates released in June showed an increase of $51 / 2$ percent in the second quarter.
    The second-quarter GNP estimates prepared in midJuly (plus 15 -day estimates) are based on the following major source data: For personal consumption expenditures ( PCE ), retail sales and unit auto and truck sales through June; for nonresidential fixed investment, the same information for autos and trucks as for PCE, April and May construction put in place, and April and May manufacturers' shipments of machinery and equipment; for residential investment, April and May construction put in place, and April and May housing starts; for change in business inventories, April and May book values for manufacturing and trade, and unit auto inventories through June; for net exports of goods and severices, April and May merchandise trade, and fragmentary information on investment income for the quarter; for government purchases of goods and services, Federal unified budget outlays for April and May, and State and local employment through June; and for GNP prices, the Consumer Price Index for April and May, the Producer Price Index for April and May, and unit-value indexes for exports and imports for April and May. Some of the source data are subject to revision.
[^2]:    1. Gasoline and oil, and fuel oil and coal.
    2. Electricity and gas.

    Note.- Percent changes in major aggregates are found in the National Income and Product Accounts Tables, table 8.1. Dollar Nore.-Percent changes in major aggregates are f.
    levels are found in tables 1.2, 1.15, 1.17, 3.8 B , and 4.4 .

[^3]:    Note.-Dollar levels are found in the National Income and Product Accounts Tables, table 5.9.

[^4]:    NoTe.-IVA is inventory valuation adjustment and CCAdj is capital consumption adjustment.
    Source: NIPA table 2.1.

[^5]:    

[^6]:    1 Consists largely of subsidies to railroads and mass transit systems.
    ${ }^{2}$ Consists largely of Federal Deposit Insurance Corporation, Federal Savings and Loan Insurance Corporation, and Bonneville Power Administration.
    ${ }^{3}$ Consists of State lotteries, off-track betting, local parking, and miscellaneous activities.

[^7]:    ${ }^{1}$ Consists largely of foreign currency transactions

[^8]:    ${ }^{1}$ Line 6 less line 13 equals rest-of-the-world product as shown in table 1.6.

[^9]:    ${ }^{1}$ Inventories are as of the end of the quarter. Quarter-to-quarter changes calculated from this table are at quarterly rates, whereas the constant-dollar change in business inventories component of GNP is stated at annual rates.
    ${ }_{3}^{2}$ Prior to 1959 , inventories held by construction establishments are included in line 5 . In 1959 , the constant-dollar value of inventories held by construction establishments was $\$ 3.4$ billion. final sales by farms. final sales by farms.

[^10]:    ${ }^{1}$ Includes Coast Guard

[^11]:    ${ }^{1}$ Equals the number of full-time equivalent employees (table 6.8.) plus the number of self-

[^12]:    ${ }^{1}$ Consists of social services, membership organizations, and miscellaneous professional $\underset{2}{\text { services. }}$
    ${ }^{2}$ Consists of receipts by all U.S. residents, including both corporations and persons, of earnings of unincorporated foreign affiliates, dividends from their incorporated foreign affiliates, and their share of reinvested earnings of their incorporated foreign affiliates, net of correspond-
    ing outflows.

[^13]:    Gross domestic purchases equals gross national product less exports plus imports; final sales to dom

[^14]:    ${ }^{1}$ Equals the deflator for gross domestic product of nonfinancial corporate business with the decimal point shifted two places to the left.

[^15]:    3. All of the cyclical adjustments are based on middle-expansion trend GNP and the associated trend unemployment rate-reference paths from which cyclical deviations are measured. See Frank de Leeuw and Thomas M. Holloway, "Cyclical Adjustment of the Federal Budget and Federal Debt," Survey 63 (December 1983): 25-40 and Thomas M. Holloway, "Cyclical Adjustment of the Federal Budget and Federal Debt: Detailed Methodology and Estımates," Bureau of Economic Analysis staff paper (forthcoming), and the references cited therein
    4. The relationship between the unemployment rate and constant-dollar GNP is frequently referred to as "Okun's law" In his original work, Okun estimated that a 10 -percentage-point increase in the unemployment rate (for unemployment rates above 40 percent) was associated with about a 3.2 percent decrease in constant-dollar GNP See Arthur M. Okun, "Potential GNP. Its Measurement and Signficance," in Proceedings of the Business and Economic Statustics Section (Washington, D.C: American Statistical Association, 1962), pp 98-104. Updates of Okun's work suggest that the 3.2 percent figure declined to about 20 percent by the late 1970's See, for example, Economuc Report of the Prestdent (Washington, D C• U S. GPO, 1979), pp. 72-76 Research at BEA supports this 2.0 percent estimate
[^16]:    8. The table shows that the effects of a 1-percentagepoint increase in the unemployment rate on total expenditures are less than those on expenditures excluding an adjustment of net interest paid This result implies that net interest paid declined The decline reflects larger short-run effects on interest rates than on net debt
[^17]:    10. The simulation measures the short-run effects of an increase in inflation on net interest paid, which was discussed earlier. Because the short run effects are very small, they are not shown separately. Complete effects would continue to develop over many quarters.
[^18]:    11. The rule reflects indexation of the Federal individual income tax starting in the first quarter of 1985.
    12. The complete model to cyclically adjust the budget consists of 42 equations and requires 49 time series.
[^19]:    13. The regressions underlying these equations are discussed in Holloway, "Detailed Methodology and Estimates," pp. 237-43.
[^20]:    20. Recently, Denison has noted an additional consideration: Much of the value of illegal products exists only because their illegality, by restricting their supply, has made their prices high; the value of the quantities of drugs now produced, for example, would be much less if they were legalized.
[^21]:    21. For this discussion, GNP will be used as shorthand for all the NIPA measures of production (for example, national income and charges against GNP).
    22. Criteria in addition to illegality put some illegal activities outside the production boundary for the NIPA's. For example, illegal nonmarket product-illustrated in table 1 by marihuana grown for own use-is excluded because, with only a few exceptions, nonmarket production is excluded. Consumer interest paid to usurers is excluded because consumer interest is excluded. Most theft is excluded because it involves redistribution, not production. See the next subsection for further discussion.
[^22]:    23. The Internal Revenue Service, in Income Tax Compliance Research: Estimates for 1973-1981, assumed, for example, that 9 percent of income from trade in heroin and cocaine is reported in disguised form, but that virtually none of the income from prostitution is reported. In contrast, income from whitecollar crime, such as embezzlement and fraud, is likely to be reported in order to maintain the appearance of legitimacy (Abt Associates, Inc.).
[^23]:    24. The marihuana example is based on Simon and Witte, who trace the chain from outside the United States to estimate the national income originating in the production and distribution of marihuana.
[^24]:    25. A new indirect method of measuring the understatement of growth in national income due to the underground economy will be presented in the Survey in the fall.
    26. For discussion of the reconciliation, see Thae $S$. Park, "Personal Income and Adjusted Gross Income 1980-82," Survey 64 (April 1984): 53-55 and the earlier articles referred to there. See also NIPA table 8.13 in the July issues of the Survey.
[^25]:    27. For similar reasons, the AGI gap is also not a measure of all the income on which taxes are evaded. See Henry 1983, for a detailed discussion.
[^26]:    28. BEA's predecessor agencies first made adjustments to correct for misreporting for corporate profits. These adjustments, as described in 1946 in introducing the newly reworked profits estimates, raised the profits reported on returns to include an estimate of the additional amounts that would be discovered by auditing of returns. In 1954, in describing the work on income of unincorporated business (proprietors), National Income ${ }^{\circ}$, noted that a "significant step forward" had been taken because information available from the Internal Revenue Service made it possible, for the first time, to adjust for understatement of the income on tax returns; previously, the estimates had been based on unaudited returns.
    29. As in the case of the AGI gap, the adjustments also are not a measure of all the income on which taxes are evaded. The major reason is that not all income types reported on tax returns are used in estimating the NIPA's.
[^27]:    30. Most statistical offices use the difference between totals derived by different estimating methodologies as cross-checks on accuracy, and review and adjust the estimates in an effort to reduce a large discrepancy. A statistical discrepancy before these efforts are undertaken is the one usually suggested as a measure of the underground economy.
[^28]:    31. See Donahoe ${ }^{\circ}$. The improved adjustments will be extended to earlier and later periods for incorporation in the NIPA's in the comprehensive revision scheduled for the end of 1985 .
[^29]:    32. See Parker ${ }^{\circ}$ for a summary of relevant information from evaluation studies of the 1977 economic censuses and from the 1979 Taxpayer Compliance Measurement Program.
    33. See table 5 in Parker ${ }^{\circ}$. For the adjustments described there, the total upward adjustment in GNP was about 42 percent of the upward adjustment in
[^30]:    34. The portion of this survey based on quarterly household surveys of a probability sample of all owner-occupied one-to-four unit residential properties is being discontinued. Data from it had been used to prepare the owner-occupied estimates until they were replaced by data from the consumer expenditure survey in preparing the preliminary revised estimates for 1977.
[^31]:    36. For perspective, it may be noted that a 10 -percent understatement for construction of 1 -unit housing implies a shortfall of 50 percent in the upward adjustments noted earlier in describing the methodology for the Census Bureau's series on the value of construction put in place.
