6 August 2011

Annual Revision of the National Income and Product Accounts

Annual Estimates for 2003–2010 Quarterly Estimates for 2003:I–2011:I

By Eugene P. Seskin and Shelly Smith

THE BUREAU of Economic Analysis (BEA) released revised estimates of the national income and product accounts (NIPAs) for 2008-2010 and for the first quarter of 2011 on July 29, 2011. In addition to the revisions for these periods, this "flexible" annual revision results in revisions to current-dollar GDP and some components back to the first quarter of 2003.2 The reference year remains 2005. In cases in which the estimates for the reference year were revised, the levels of the related index numbers and the chained-dollar estimates for the entire historical period are revised, but revisions to percent changes before the first quarter of 2003 are small. As is usual in annual NIPA revisions, these estimates incorporated newly available source data that are more complete, more detailed, and otherwise more reliable than those that were previously incorporated.

This annual revision has not greatly changed the general picture of the economy for the past several years (in keeping with research that shows that annual revisions historically have not greatly changed the overall picture painted by earlier estimates).³ However, the revised estimates indicate that the depth of the recession was deeper and that the subsequent period of expansion was somewhat less robust. The revised estimates of the change in real GDP show that for the period of contraction from the fourth quarter of 2007 to the second quarter of 2009, real GDP decreased at an average annual rate of 3.5 per-

cent; in the previously published estimates, it had decreased 2.8 percent. For the period of expansion from the second quarter of 2009 to the first quarter of 2011, real GDP increased at an average annual rate of 2.6 percent; in the previously published estimates, it had increased 2.8 percent.⁴

The revised *annual* estimates of prices show similar rates of change to the previously published estimates for the featured price indexes. However, the *quarterly* estimates of the rates of change for the GDP price index show notable and mostly offsetting revisions because of a change in methodology for estimating real petroleum imports (see page 27).

GDP highlights

By historical standards, the revisions to year-to-year percent changes in real GDP are typical for 2008 and 2010; however, the downward revision of 0.9 percentage point for 2009 is large. In the annual NIPA revisions since 1982, the revisions (without regard to sign) to the annual estimates have averaged 0.3 percentage point. The following are highlights of this annual revision.

- From 2007 to 2010, real GDP decreased at an average annual rate of 0.3 percent; in the previously published estimates, the rate of change in real GDP was less than 0.1 percent.⁵ From the fourth quarter of 2007 to the first quarter of 2011, real GDP decreased at an average annual rate of 0.2 percent; in the previously published estimates, real GDP had *increased* at an average annual rate of 0.2 percent (table 1).
- The percent change in real GDP from the preceding year was revised down from a decrease of less than 0.1 percent to a decrease of 0.3 percent for 2008, was revised down from a 2.6 percent decrease to a 3.5

^{1.} Information about the structure, definitions, presentation, and methodologies that underlie the NIPAs is available on BEA's Web site; go to www.bea.gov, and click on "Methodology Papers."

^{2.} Flexible annual revisions that include revisions for longer periods than the traditional 3-year period were described in the June 2008 SURVEY OF CURRENT BUSINESS at www.bea.gov/scb.

^{3.} BEA judges the accuracy of the estimates by whether they present the same general picture of economic activity as previous estimates in terms of long-term growth rates, trends in key components of GDP, broad features of the business cycle, including the timing and depth of recessions, the strength of recoveries, the major components contributing to growth and to contractions, and the pattern of quarterly growth. For more about the accuracy of annual revisions, see Dennis J. Fixler, Ryan Greenaway-McGrevy, and Bruce T. Grimm, "Revisions to GDP, GDI, and Their Major Components," Survey 91 (July 2011): 9–31.

^{4.} For more on this annual revision and the 2007–2009 recession and recovery, see FAQs 1003 and 1004 on BEA's Web site.

^{5.} The annual revisions to real GDP reflect revised current-dollar estimates, revised prices used for deflation, and revised quantities used to estimate components of real GDP by extrapolation or direct valuation. For estimates prepared by extrapolation or direct valuation, the current-dollar and chained-dollar estimates are based on independent source data; consequently, the corresponding revisions are unrelated. For a list of these components, see table 2 in "Updated Summary NIPA Methodologies," Survey 90 (November 2010): 25–29.

percent decrease for 2009, and was revised up from a 2.9 percent increase to a 3.0 percent increase for 2010 (chart 1 and pages 9 and 10).

- From fourth quarter to fourth quarter, the percent change in real GDP was revised down from a 2.8 percent decrease to a 3.3 percent decrease for 2008, was revised down from a 0.2 percent increase to a 0.5 percent decrease for 2009, and was revised up from a 2.8 percent increase to a 3.1 percent increase for 2010.
- The revisions to the fourth-quarter-to-fourth-quarter rates of change in real GDP reflect revisions to the quarters within the years. For 2008, the annual rates of change in real GDP for the first quarter and the fourth quarter were revised down 1.1 percentage points and 2.1 percentage points, respectively, while the rates of change for the second quarter and the third quarter were revised up 0.7 percentage point and 0.3 percentage point, respectively. For 2009, the revision reflected downward revisions to the annual rates of change in real GDP of 1.8 percentage points and 1.2 percentage points for the first quarter and the fourth quarter, respectively; the rate for the second quarter was unrevised, and the rate for the third quarter was revised up

only 0.1 percentage point. For 2010, the annual rates of change in real GDP for the first quarter and the second quarter were revised up 0.2 percentage point and 2.1 percentage points, respectively, and the rates of change for the third quarter and the fourth quarter were revised down 0.1 percentage point and 0.8 percentage point, respectively.

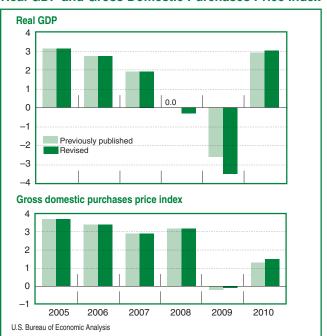

Price highlights

The revised annual estimates of prices show similar rates of change to the previously published estimates.

- The percent change from the preceding year in the price index for gross domestic purchases was unrevised at 3.2 percent for 2008, was revised up from a decrease of 0.2 percent to a decrease of 0.1 percent for 2009, and was revised up from an increase of 1.3 percent to an increase of 1.5 percent for 2010. The percent change from the preceding year in the price index for GDP was unrevised at 2.2 percent for 2008, was revised up 0.2 percentage point to 1.1 percent for 2009, and was revised up 0.2 percentage point to 1.2 percent for 2010 (chart 1 and table 2).6
- From the fourth quarter of 2007 to the first quarter of 2011, the average annual rate of increase in the price index for gross domestic purchases was revised up from

6. For a discussion of the difference between the gross domestic purchases price index and the GDP price index, see the box "Note on Prices" on page 3 in this issue.

Chart 1. Revisions to Annual Percent Changes in Real GDP and Gross Domestic Purchases Price Index

1.4 percent to 1.6 percent, and the average annual rate of increase in the GDP price index was revised up from 1.4 percent to 1.5 percent. The average annual rate of increase in the price index for personal consumption expenditures (PCE) was revised up from 1.6 percent to 1.7 percent, and the rate of increase in the "core" PCE price index (which excludes food and energy) was revised up from 1.5 percent to 1.6 percent.

Income and saving highlights

- From 2007 to 2010, real disposable personal income (DPI) grew at an average annual rate of 0.6 percent; in the previously published estimates, real DPI had grown at an average annual rate of 1.2 percent.
- Personal saving was revised up \$144.4 billion for 2008, was revised down \$102.7 billion for 2009, and was

revised down \$61.1 billion for 2010. Personal saving as a percentage of disposable personal income was revised up 1.3 percentage points to 5.4 percent for 2008, was revised down 0.8 percentage point to 5.1 percent for 2009, and was revised down 0.4 percentage point to 5.3 percent for 2010.

- National income was revised up \$51.3 billion (or 0.4 percent) for 2008, was revised down \$77.4 billion (or 0.6 percent) for 2009, and was revised up \$18.5 billion (or 0.1 percent) for 2010.
- Corporate profits was revised down \$14.4 billion (or 1.1 percent) for 2008, was revised up \$104.0 billion (or 8.3 percent) for 2009, and was revised up \$175.3 billion (or 10.8 percent) for 2010.

Improvements

These estimates also reflect a number of improvements in methodology and presentation that are discussed on pages 25–27. These improvements include the following:

- Incorporating data from the Census Bureau annual and monthly retail trade and food services surveys and from the service annual survey that have been benchmarked to the 2007 Economic Census, as well as economic census data for merchandise lines back to 2003.
- Incorporating improved quality-adjusted price indexes for deflating communication equipment in private fixed investment, in exports, and in imports back to 2003.
- Improving the method of seasonally adjusting real petroleum imports back to 2007.
- Improving the presentation of government social benefits in the personal income and outlays tables.

This article discusses the impact of the revisions on key NIPA measures, summarizes the revisions to the major aggregates, lists the major source data incorporated, and describes the changes in methodology and presentation. Appendix A presents the revised annual estimates and the revisions for the seven summary accounts of the NIPAs (see pages 29 and 30). In addition, tables presenting revised monthly, quarterly, and annual NIPA estimates and the "advance" estimates for the second quarter of 2011 are presented in "National Income and Product Accounts Tables" in this issue.

		-		-

The annual percent change in real GDP was revised down from a decrease of less than 0.1 percent to a decrease of 0.3 percent for 2008, was revised down from a 2.6 percent decrease to a 3.5 percent decrease for 2009, and was revised up from a 2.9 percent increase to a 3.0 percent increase for 2010.

• For 2008, the largest contributors to the downward revision to the percent change in real GDP were downward revisions to PCE, to nonresidential fixed investment, and to state and local government spending.

• For 2009, the largest contributors to the downward revision to the percent change in real GDP were downward revisions to PCE, to private inventory investment, and to nonresidential fixed investment and an upward revision to imports.

• For 2010, the largest contributors to the upward revision to the percent change in real GDP were upward revisions to private inventory investment and to PCE. The contributions of these components were partly offset by downward revisions to nonresidential fixed investment, to state and local government spending, to residential fixed investment, and to exports.

For 2008, the downward revision to PCE for services was to financial services and insurance (mainly health insurance) and to "other" services (mainly "net foreign travel").

The downward revision to investment in equipment and software reflected downward revisions to all categories of information processing equipment and software (computers and peripherals, software, and "other").

The downward revision to state and local government spending was mostly accounted for by a downward revision to consumption expenditures.

For 2009, the downward revision to PCE for goods was to both durable goods (mainly recreational goods and vehicles and "other" durable goods) and to non-durable goods (widespread).

The downward revision to PCE for services reflected downward revisions to financial services and insurance (specifically, "financial services furnished without payment" and portfolio management and investment advice services), recreation services, and "other" services.

The downward revision to nonresidential structures was widespread.

The downward revision to investment in equipment and software was more than accounted for by a downward revision to information processing equipment and software.

For 2010, the upward revision to PCE for services reflected upward revisions to "other" services (mainly, communication services), recreation services, financial services and insurance, and food services and accommodations.

The downward revision to investment in nonresidential structures reflected downward revisions to petroleum and natural gas drilling and to power structures.

The downward revision to residential investment was to structures (mainly residential improvements).

The downward revision to state and local government spending reflected downward revisions to consumption expenditures and to gross investment (specifically, investment in structures).

^{1.} Percentage points.

Annual Price Indexes

Revisions to the chain-type price indexes result from the incorporation of newly available and revised source data and from the regularly scheduled incorporation of annual weights for the most recent year (2010). In this annual revision, the source data for price indexes that are used for deflation and the source data that affect implicit prices were revised. The prices used for deflation also reflect updated seasonal factors, including the improved seasonal adjustment of imports of petroleum. In addition, improved price indexes for deflating PCE for property and casualty insurance and for deflating communication equipment in private fixed investment, in exports, and in imports have been incorporated. (See "Changes in Methodology and Presentation" on pages 25–27.)

The percent change from the preceding year in the price index for gross domestic purchases was unrevised at 3.2 percent for 2008, was revised up 0.1 percentage point to -0.1 percent for 2009, and was revised up 0.2 percentage point to 1.5 percent for 2010 (see chart 1 and table 5). The annual percent change in the price index for GDP was unrevised at 2.2 percent for 2008, was revised up 0.2 percentage point to 1.1 percent for 2009, and was revised up 0.2 percentage point to 1.2 percent for 2010 (see the addendum to table 5).

For 2008, the price index for gross domestic purchases was unrevised, reflecting offsetting revisions. The most

notable revision was an upward revisions to the price index for fixed investment in equipment and software. The largest contributor to this revision was communication equipment prices, based on the incorporation of improved qualityadjusted price indexes (see page 26).

For 2009, the largest contributors to the upward revision to the price index for gross domestic purchases were the price index for fixed investment in equipment and software, prices associated with private inventory investment, and the price index for PCE for services. The revision to the price index for fixed investment in equipment and software again reflected the newly incorporated price indexes for communication equipment. The revision to the prices associated with private inventory investment reflected an upward revision to the prices of nondurable-goods manufacturing inventories (mainly petroleum and coal products). The revision to the price index for PCE for services primarily reflected an upward revision to the price index for financial services and insurance, mainly reflecting an upward revision to the prices of "financial services furnished without payment."

For 2010, the largest contributors to the upward revision were the price index for PCE for services and the price index for federal government spending. The revision to the price index for PCE for services again mainly reflected an upward revision to the prices of "financial services furnished without payment." The revision to the price index for federal government spending was in both defense and nondefense spending and reflected upward revisions to the implicit prices for compensation.

^{1.} Percent change from the preceding period

^{1.} The implicit prices are computed by dividing the current-dollar estimates by the chained-dollar estimates that are derived from the quantity data used in quantity extrapolation and direct valuation. Thus, differences between the current-dollar revisions and the chained-dollar revisions to these components are reflected as revisions to their implicit prices.

Quarterly Estimates

Revisions to the quarterly (and monthly) NIPA estimates reflect (1) revisions to the annual estimates that reflect the incorporation of newly available annual source data, (2) the incorporation of newly available and revised monthly and quarterly source data (including updated seasonal factors that are used to indicate quarterly patterns), and (3) methodology improvements (see "Changes in Methodology and Presentation").

Real GDP. The revisions to the 13 quarterly percent changes (at annual rates) from the fourth quarter of 2007 to the first quarter of 2011 averaged 0.9 percentage point (without regard to sign). (In the annual NIPA revisions since 1979, the revisions to the quarterly estimates have averaged 0.7 percentage point.)

The quarterly revisions did not change the direction of change (increase or decrease) in real GDP for any quarter. The quarterly percent change in real GDP was revised down for 7 of the 13 quarters, was revised up for 5 of the 13 quarters, and was unrevised for 1 quarter. The largest downward revision to the percent change in real GDP was 2.1 percentage points to -8.9 percent for the fourth quarter of 2008. The largest contributors to the revision were an upward revision to imports (mostly accounted for by petroleum imports) and a downward revision to PCE (widespread within services and goods); these revisions were partly offset by an upward revision to private inventory investment.1 The largest upward revision to the quarterly percent change in real GDP was 2.1 percentage points to 3.8 percent for the second quarter of 2010. The largest contributors to the revision were a downward revision to imports (the largest contributor was again petroleum imports) and an upward revision to PCE (the largest contributors were "other" services and recreation services).

Prices. In general, the quarterly percent changes for gross

domestic purchases prices were similar to the previously published estimates; the revisions to the 13 quarterly percent changes (at annual rates) from the fourth quarter of 2007 to the first quarter of 2011 averaged 0.1 percentage point (without regard to sign). The price index was revised up for 8 quarters, was revised down for 1 quarter, and was unrevised for 4 quarters. The largest upward revision was 0.4 percentage point to both the fourth quarter of 2008 and the second quarter of 2010. For the fourth quarter of 2008, the percent change in the index was revised from -4.4 percent to -4.0 percent; the largest contributors to the revision were prices for PCE for services (mainly health care prices and prices for foreign travel by U.S. residents), prices associated with private inventory investment (mainly prices of petroleum and coal products in nondurablegoods manufacturing), and prices of equipment and software (the largest contributor being communication equipment). For the second quarter of 2010, the percent change in the index was revised from 0.1 percent to 0.5 percent; the largest contributor to the revision was prices for PCE for services (which was more than accounted for by financial services and insurance—mainly "financial services furnished without payment").

The quarterly percent changes for GDP prices were revised much more than those for gross domestic purchases prices. For GDP prices, the revisions to the 13 quarterly percent changes (at annual rates) from the fourth quarter of 2007 to first quarter of 2011 averaged 0.8 percentage point (without regard to sign). The percent change was revised up for seven quarters and was revised down for six quarters. The largest upward revision was 1.7 percentage points, from a decrease of 1.2 percent to an increase of 0.5 percent, for the fourth quarter of 2008; the largest contributor to the revision was imports of goods (more than accounted for by petroleum imports). The largest downward revision was 1.4 percentage points, from 4.5 percent to 3.1 percent, for the third quarter of 2008; the largest contributor to the revision was again petroleum imports.

^{1.} Percentage points

^{1.} For more on the revision history for the fourth quarter of 2008, see FAQ 1003 on BEA's Web site.

This table shows NIPA components with revisions of \$5.0 billion or more (in absolute value) for 2008–2010. The table also lists the major source data that were incorporated as part of this annual revision. Note that

the incorporation of newly available and revised source data for a year usually results in a revision to the level of an estimate both for that year and for subsequent years.

^{2.} Revisions also reflect revisions to earlier years. Revised estimates begin with 2003, based on revised Census Bureau data from the Annual Retail Trade Survey and the Service Annual Survey that were benchmarked to the 2007 Economic Census, and on updated merchandise-line data from the 2007 Economic Census.

Revisions also reflect revisions to earlier years. Revised estimates begin with 2003, reflecting revised benefits-to-premiums ratios based on new trade source data on insurance.

^{4.} For more information on the revisions to the International Transactions Accounts, see Mai-Chi Hoang and Erin M. Whitaker, "Annual Revision of the U.S. International Transactions Accounts," Survey of Current Business 91 (July 2011): 47–61.

5. The statistical discrepancy is gross domestic product (GDP) less gross domestic income (GDI); it is also the difference between gross national product (GNP) and gross national income (GNI), which is GDI plus net income receipts from the rest of the world. The statistical discrepancy arises because the

Effects of the "Flexible" Annual Revision in Earlier Periods

As noted earlier, as part of this "flexible" annual revision, current-dollar GDP and some components were revised back to 2003. For 2003–2007, the annual percent change in real GDP was unrevised for all years except for 2004, when the growth rate was revised from 3.6 percent to 3.5 percent.

During this earlier period, current-dollar GDP for 2004–2007 was revised down; for 2003, current-dollar GDP was revised up only \$0.1 billion. For 2003–2007, the most notable revisions were to PCE for services, which was revised down each year. The revisions primarily reflected the incorporation of data from the 2008

and 2009 Census Bureau Service Annual Surveys that were benchmarked to the 2007 Economic Census and of data from A.M. Best that were used to estimate medical and hospitalization insurance.¹ For 2007, an offsetting downward revision to petroleum imports reflected the incorporation of revised data from BEA's international transactions accounts.

As a result of these revisions, for 2004–2007, personal saving and the personal saving rate were revised up (see the addenda in table 8).

See the box "The Statistical Discrepancy" in Robert P. Parker and Eugene P. Seskin, "Annual Revision of the National come and Product Accounts," SURVEY 77 (August 1997): 19.
 CCAdj Capital consumption adjustment

IVA Inventory valuation adjustment

For the most recent 3 years, national income was revised up \$51.3 billion for 2008, was revised down \$77.4 billion for 2009, and was revised up \$18.5 billion for 2010. Gross domestic income (GDI) was revised up \$61.5 billion for 2008, was revised down \$78.4 billion for 2009, and was revised up \$23.5 billion for 2010.

- For 2008, the revision to national income reflected upward revisions to net interest and miscellaneous payments, to supplements to wages and salaries, and to rental income of persons with capital consumption adjustment (CCAdj).
- The upward revisions were partly offset by downward revisions to corporate profits with inventory valuation adjustment (IVA) and CCAdj and to wage and salary accruals.
- The statistical discrepancy, the difference between GDI and GDP, was revised from 1.0 percent of GDP to less than 0.1 percent of GDP for 2008.
- For 2009, the revision to national income reflected large downward revisions to net interest and miscellaneous payments and to nonfarm proprietors'
- The downward revisions were partly offset by a large upward revision to corporate profits with IVA and CCAdj and an upward revision to rental income of persons with CCAdj.
- The statistical discrepancy was revised from 1.3 percent of GDP to 0.6 percent of GDP for 2009.
- For 2010, the revision to national income reflected large upward revisions to corporate profits with IVA and CCAdj and to rental income of persons with CCAdj.
- The upward revisions were partly offset by a large downward revision to net interest and miscellaneous payments and smaller downward revisions to nonfarm proprietors' income with IVA and CCAdj and to supplements to wages and salaries.
- The statistical discrepancy was revised from 1.1 percent of GDP to less than 0.1 percent of GDP for 2010.

Discontinuities in NIPA Foreign Transactions

The revisions to net exports of goods and services reflect the annual revision of BEA's international transactions accounts (ITAs), which incorporated new and updated source data.¹

For most components, the revisions to the ITAs for 2008–2010 were incorporated into the NIPAs at their "best level." However, revised ITA estimates for petroleum imports were incorporated into the NIPAs beginning with 2007 (see "Seasonal adjustment of petroleum

imports" on page 27).² As a result, there are small discontinuities between the NIPA estimates for 2007 and those for 2008 (table 10) and somewhat larger discontinuities within these categories for the estimates of goods and services due to reclassifications (see "Foreign transactions" on pages 26 and 27).

For current-dollar net exports of goods and services (and for current-dollar GDP), the change from 2007 to 2008 was overstated by \$4.5 billion.

Table 10. Discontinuities in NIPA Foreign Transactions, 2007–2008

^{1.} Equals the revisions to the U.S. international transactions accounts that have not been carried back in the NIPAs at this time.

^{1.} See Mai-Chi Hoang and Erin M. Whitaker, "Annual Revision of the U.S. International Transactions Accounts," Survey 91 (July 2011): 47–61.

^{2.} The revisions to the remaining ITA components for years before 2008 will be incorporated in a future NIPA revision.

Source Data and Data Availability

Source Data Incorporated in the 2011 Annual Revision

In this annual revision, PCE is revised back to 2003 to incorporate source data from the 2007 Economic Census (specifically, data on merchandise lines) and data from the Census Bureau annual and monthly retail trade and food services surveys and from the Census Bureau service annual survey that were benchmarked to the 2007 Economic Census.

In addition, the annual revision incorporated data from the following major federal statistical sources: Census Bureau annual surveys of manufactures for 2008 (revised) and 2009 (preliminary); Census Bureau annual surveys of merchant wholesale trade and of retail trade for 2008 (revised) and for 2009 (preliminary); Census Bureau revised monthly indicators of manufactures, of merchant wholesale trade, and of retail trade for 2008–2010; Census Bureau service annual surveys for 2008 (revised), 2009 (revised), and 2010 (preliminary); annual

surveys of state and local government finances for fiscal years 2007 (revised), 2008 (revised), and 2009 (preliminary); Census Bureau monthly survey of construction spending (value put in place) for 2009 and 2010 (revised); Census Bureau quarterly services survey for 2008–2010 (revised); Census Bureau current population survey/housing vacancy survey for 2010; federal government budget data for fiscal years 2010 and 2011; Internal Revenue Service tabulations of tax returns for corporations for 2008 (revised) and 2009 (preliminary) and for sole proprietorships and partnerships for 2009; Bureau of Labor Statistics (BLS) quarterly census of employment and wages for 2008–2010 (revised); BLS occupational employment survey data for 2010; Department of Agriculture farm statistics for 2008-2010 (revised); and BEA's international transactions accounts for 2008-2010 (revised).

Data Availability

An extensive set of estimates is presented in "National Income and Product Accounts" in this issue. These estimates and annual estimates for 1929 forward and quarterly estimates for 1947 forward are available on BEA's Web site at www.bea.gov.

Selected revised NIPA estimates and related estimates will be published in upcoming issues of the SURVEY. The September SURVEY will present the following NIPA tables: tables 3.15–3.17 (government spending by function) and table 7.15 (which shows the relationship between net farm income in the NIPAs and net farm income from the USDA). It will also present new estimates of fixed assets and consumer durable goods beginning with 2000.¹

The October Survey will present the following NIPA tables: table 3.18 (reconciliation of NIPA federal government estimates with federal budget data), tables 3.20 and 3.21 (state government and local government current

receipts and expenditures), and tables 3.22 and 3.23 (federal government and state and local government current receipts and expenditures seasonally unadjusted estimates). It will also present real inventories, sales, and inventorysales ratios for manufacturing and trade for the fourth quarter of 2007 through the second quarter of 2011. In addition, revised estimates of state personal income that incorporate the results of this annual revision of the NIPAs will be presented.

The November Survey will feature the "Updated Summary of NIPA Methodologies," which lists the principal source data and estimating methods that are used in preparing the current-dollar and real estimates of GDP. In addition, NIPA table 2.9 (personal income by households and by nonprofit institutions serving households) and table 7.20 (nonprofits reconciliation table) will be presented.

NIPA table 3.19 (reconciliation of NIPA state and local government estimates with Census Bureau data) will be presented in the Survey soon after the data become available.

^{1.} BEA's Web site will present revisions to the fixed assets accounts, beginning with 1901 for investment and 1925 for stocks and depreciation.

Changes in Methodology and Presentation

As part of the annual revision of the NIPAs, a number of changes in methodology and presentation have been incorporated.¹

Personal consumption expenditures (PCE). Beginning with the first quarter of 2003, the estimates of PCE reflect the incorporation of (1) data from the Census Bureau annual and monthly retail trade and food services surveys and from the service annual survey that have been benchmarked to the 2007 Economic Census and (2) economic census data for merchandise lines back to 2003.

Most of the estimates of PCE for goods use a retail control methodology, in which merchandise-line (or product-line) sales at various types of retail businesses are used to weight retail sales. These merchandise-line sales are based on data from the quinquennial economic census. In general, product-based data on consumer spending are not available between censuses, and estimates for detailed PCE categories are prepared by extrapolating retail sales by kind of business using the merchandise-line data from the most recent economic census. Merchandise-line data from the 2007 Economic Census became available at the end of 2010. To more accurately reflect consumer spending patterns, BEA has incorporated these data in this flexible annual revision rather than waiting until the next comprehensive revision of the NIPAs, which is scheduled for 2013.

Similarly, the data from the annual retail trade survey and the service annual survey were benchmarked to the 2007 Economic Census this spring, and BEA has also incorporated these benchmarked surveys in this flexible annual revision. In addition, BEA has updated the "retail control group"—the PCE categories to which the control total (total retail sales) must sum. Food services industries have been removed from the control group to reflect the reclassification of food service categories from goods to services during the 2009 comprehensive revision.² For goods bought at grocery stores and various types of electronic stores, categories are better aligned with the retail point-of-sale scanner data now used to annually update merchandise-line allocations. Together, the incorporation of the recently released data and the updated control

group will improve the accuracy of the PCE estimates and will reduce future revisions.

PCE insurance estimates. As part of the 2003 comprehensive NIPA revision, the methodology for estimating property and casualty insurance services was changed.³ The estimates of net property and casualty insurance services are computed as total premiums minus expected losses, where total premiums consist of direct premium payments and net investment income on funds attributed to policyholders; expected losses are estimated using the framework of adaptive expectations. The difference between the expected losses and the actual losses is the net settlements of insurance services, which is recorded in the national accounts as transfer payments between business (insurers) and consumers (policyholders).

As part of this annual revision, for various types of property and casualty insurance services, beginning with the estimates for 2008, a consistent single-deflation method is used to deflate both total premiums and expected losses, based on corresponding producer price indexes (PPIs).

Previously, the estimates of net premiums and losses for some insurance services, such as private automobile insurance, were deflated using a single deflator based on consumer price indexes (CPIs), while the estimates of other insurance services, such as household insurance, were deflated using a double-deflation method with separate CPIs to deflate premiums and losses. The PPIs are more suitable for deflating insurance services than the CPIs because PPIs track changes in the total revenue received by insurers—both the total direct premiums and the investment income received by insurers.

For medical care and hospitalization insurance services, beginning with the estimates for 2003, timely and comprehensive source data from A.M. Best are incorporated to improve the annual estimates. These insurance services are estimated as premiums less benefits (or claims). First, A.M. Best data on annual premiums and benefits for private health insurance and for Medicare Advantage Plans and Medicaid Managed Care programs are used to derive an annual benefits-to-premiums ratio. Second, *total* annual premiums are estimated using data from the Medical Expenditures Panel Survey (MEPS)

^{1.} These changes update the information in the two tables that were published in "Updated Summary NIPA Methodologies" in the November 2010 SURVEY; these tables will be updated in the November 2011 SURVEY.

^{2.} The current estimate of PCE for purchased meals and beverages continues to be extrapolated by sales at food services and drinking places from the Census Bureau's monthly retail trade survey.

^{3.} See Baoline Chen and Dennis J. Fixler, "Measuring the Services of Property-Casualty Insurance in the NIPAs: Changes in Concepts and Methods," SURVEY 83 (October): 10–26.

Changes in Methodology and Presentation

and from the Office of Personnel Management (OPM) on federal employees' health insurance, and these data are supplemented by the A.M Best premiums data for Medicare Advantage Plans and Medicaid Managed Care Programs.⁴ Third, total annual insurance benefits are derived by applying the benefits-to-premiums ratio to the total premiums estimate.

Previously, medical care and hospitalization insurance benefits were derived using a benefits-to-premiums ratio that was based on benefits and premiums data from the Census Bureau's economic census. This ratio was held constant between census years, and the annual insurance estimates were derived by applying the ratio to annual premiums data from the MEPS and OPM, which did not cover premiums earned by private insurance carriers for Medicare Advantage Plans or for Medicaid Managed Care Programs.

Current quarterly and monthly estimates of medical care and hospitalization insurance benefits continue to be judgmental extrapolations and interpolations of the annual estimates.

Expanded use of QSS data. As part of the 2005 annual revision, BEA began incorporating data from the Census Bureau's quarterly services survey (QSS) into its estimates. Since then, the Census Bureau has expanded the coverage of the survey. Beginning with estimates for the first quarter of 2011, BEA is incorporating newly available QSS data on "other financial investment activities" into the quarterly estimates of PCE for portfolio management and investment advice services. Previously, the monthly and quarterly PCE estimates were extrapolated using 3-month moving averages of total weekly earnings data from BLS for the portfolio management and investment advice industries. About 40 percent of the quarterly estimates of PCE for services is now based on the QSS data.5 As the Census Bureau expands the QSS to cover more industries, BEA will continue to incorporate the newly available quarterly data in order to continue to improve the estimates of PCE for services.

Communication equipment prices. In the 2010 annual revision, BEA adopted three quality-adjusted price indexes from the Federal Reserve Board's (FRB) indus-

trial production index program to deflate business purchases of several types of communication equipment.⁶ (A fourth index was already being used to deflate data networking equipment.) The FRB indexes account for changes in product quality better than the previously used price indexes, which were based on PPIs and international price indexes. As part of this year's annual revision, beginning with the estimates for the first quarter of 2003, FRB price indexes having more comprehensive product coverage are used to deflate these communication equipment estimates. However, because the FRB indexes are not available for the current quarterly estimates, the PPI for host computers will continue to be used as an indicator to extrapolate the price indexes for these types of equipment. For consistency, the adoption of the improved FRB price indexes (including the index for data networking equipment) has been carried back to the first quarter of 2003 for the deflation of exports and imports of communication equipment—the lowest deflation-level detail and a component of "other" capital goods.

Foreign transactions. BEA's international transactions accounts (ITAs) are the primary source data for foreign transactions in the NIPAs. As part of this year's annual revision of the ITAs, several types of foreign transactions were reclassified, and other important changes were made as part of a multiyear effort to modernize and enhance the accounts and to align them with updated guidelines for international economic accounts.⁷ Several of these changes affect NIPA foreign transactions and are incorporated, beginning with the estimates for 2008:

- Reclassification of cruise fares in exports and imports of services from passenger fares to travel,
- Reclassification of postal services in exports and imports of services from U.S. government miscellaneous services, a subcomponent of "other" services, to "other" transportation services,
- Reclassification of fees for the rights to distribute film and television recordings from "other" private services to royalties and license fees,
- Exclusion of expenditures of foreign nationals working at international organizations in the United States from

^{4.} The MEPS is conducted by the Census Bureau for the Department of Health and Human Services and provides national and state estimates of premiums for employer-sponsored health insurance coverage for private- and public-sector employers.

^{5.} For a detailed list of the PCE components that are estimated using the QSS, see FAQ 315 on BEA's Web site.

^{6.} See Eugene P. Seskin and Shelly Smith, "Annual Revision of the National Income and Product Accounts," SURVEY 90 (August 2010): 23.

^{7.} For further details on these changes, see Hoang and Whitaker.

Changes in Methodology and Presentation

"other" private services and inclusion of their compensation in compensation of employees, and

August 2011

• Change in the recording of U.S. government income on holdings and allocations of special drawing rights from a net basis to a gross basis.

Seasonal adjustment of petroleum imports. As part of the 2009 comprehensive revision, BEA began seasonally adjusting petroleum import prices and began deriving seasonally adjusted real petroleum imports by deflation because oil prices exhibited a seasonal pattern: prices for the second and third quarters tended to be higher than the prices for the first and fourth quarters.8 However, more recent analysis has shown that the extreme volatility in petroleum prices, particularly during 2007–2009, substantially affected the estimated seasonal factors for recent periods. To improve the seasonal adjustment, beginning with the first quarter of 2007, the estimates of real petroleum imports are derived by directly seasonally adjusting the quantity data for imported petroleum from BEA's ITAs at the detailed end-use level (crude oil, fuel oil, other petroleum products, and liquefied petroleum gases). Both the chained-dollar values of petroleum imports at the detailed end-use level, which are derived by direct valuation, and the corresponding current-dollar estimates are also revised, beginning with the estimates for the first quarter of 2007; all the other revisions associated with the ITAs are incorporated on a "best-level" basis beginning with the estimates for the first quarter of 2008.9 (See "Discontinuities in NIPA Foreign Transactions" on page 23.)

State and local government investment in motor vehicles. Beginning with 2008, the annual and current quarterly estimates of state and local government expenditures on motor vehicles, which account for about 30 percent of state and local government investment in equipment, reflect motor vehicle registration data from a trade source and average purchase price information developed at BEA. Previously, the annual estimates were derived from Census Bureau government finances data that are available with a 2-year lag. Specifically, annual motor vehicle investment was estimated as a proportion of total equipment expenditures from the government fi-

nances data based on information from BEA's input-output accounts. Current quarterly estimates were based on a judgmental trend of the annual estimates.

Rental income of persons. Beginning with 2008, the estimates of rental income of persons reflect an improved methodology for calculating the effective rate of interest on mortgage debt outstanding, which is used to derive the estimates of mortgage interest paid—the largest expense deducted in the calculation of rental income. The new method is based on up-to-date monthly mortgage servicing data on detailed loan characteristics, including loan type, loan performance, current interest rate, and unpaid balance. Previously, the effective rate of interest was based on a perpetual inventory of mortgage loans with interest payments by mortgage type calculated on the debt outstanding for each quarter's (past and current) loan originations. This reliance on aggregate loan information required a number of assumptions in the calculation of the effective rate of interest. The use of the newly incorporated loan-specific information provides a more accurate picture of loan performance in the mortgage market and will improve the estimates of mortgage interest paid.

This change in the methodology for deriving mortgage interest paid is also reflected in the revised annual and quarterly estimates of net interest and personal interest income and the extrapolation of the current monthly and quarterly estimates of these components.

Presentation of government social benefits. In tables 2.1 and 2.6, which show personal income and its components, a new, consistent presentation of government social benefits focuses on the largest and most significant programs: social security, Medicare, Medicaid, unemployment insurance, veterans benefits, and "other" benefits. Previously, social security and Medicare were shown as "old-age, survivors, disability, and health insurance benefits," and Medicaid was part of "other" benefits. In addition, for consistency, unemployment compensation for ex-service members is now classified as unemployment insurance benefits in these tables. Previously, in these tables, it was included as veterans benefits, but in table 3.12 (government social benefits), it was included as unemployment insurance of federal employees. In addition, in table 3.12 "old-age, survivors, and disability insurance" is now shown as "social security," and "hospital and supplementary medical insurance" is now shown as "Medicare."

Acknowledgments

Brent R. Moulton, Associate Director for National Economic Accounts, supervised the preparation of this year's annual revision of the national income and product accounts. Pamela A. Kelly, Chief of the Government Division, and Robert J. Kornfeld, Deputy Chief of the National Income and Wealth Division, directed major parts of the revision. Carol E. Moylan, Associate Director for Industry Accounts and former Chief of the National Income and Wealth Division, directed the early planning of the revision.

BEA staff who made significant contributions to the revision are listed below.

Estimate coordination and review: David F. Sullivan, Alyssa E. Holdren, Eugene P. Seskin, Shelly Smith, David B. Wasshausen.

Personal consumption expenditures: Michael Armah. Goods: Harvey L. Davis, Jr., Yukun Fung, Megan E. Groll, Everette P. Johnson, Danit E. Kanal. Services: Kyle J. Brown, Robert N. Ganz III, Christina D. Hovland, Teresita D. Teensma, Matthew D. Tschetter.

Investment and Foreign transactions: Jennifer A. Ribarsky. Inventories, foreign transactions, and prices: Harry Johnson, Jr., Michael M. Cortez, Marissa J. Crawford, Jeff Hall, Corttney C. Penberthy, Enrico Tan. Structures, equipment and software: Jeffrey W. Crawford, Velma P. Henry, Lindsay Orphanides, Marlyn Rodriguez, Linden L. Webber.

Federal government: Benjamin A. Mandel, Peter G. Beall, Stan J. Bellotti, Andrew P. Cairns, Andrea L. Cook, Raymen G. LaBella, Mark S. Ludwick, Ann Miller, Kyle D. Mulgrew, Farah Naz, Michelle D. Robinson, Mary L. Roy, Benyam Tsehaye, Andrew E. Vargo,

Bryan Williams, Keith Zipay.

State and local government: Bruce E. Baker, Steven J. Andrews, Michelle S. Grier, Natalie M. Hayes, Angela C. Padalecki, Brian E. Parks.

Personal income: Kurt Kunze. Employee compensation: Janet H. Kmitch, Elizabeth C. Bernstein, James E. Rankin, Kate L. Shoemaker, Brian J. Smith. Business income: Howard I. Krakower, Andrew W. Hodge, M. Greg Key, Martin L. Simmons, Jerry L. Stone, Garth K. Trinkl, Dennis R. Weikel. Property income: Michael N. Hayes, Louise V. Lusby, Denise A. McBride, Charles S. Robinson, Andrew G. Schmidt, Elizabeth M. Terroni.

Consumption of fixed capital: Private: David B. Wasshausen, Michael T. Cusick, Michael D. Glenn, Lisa A. Lynn, Nadia F.P. Sadée. Government: Jennifer A. Bennett, Mark A. Bailey, Mark A. Ledbetter, Christopher B. Mbu.

Computer systems and operations: Brendan J. Leary, Michael J. Boehm, Wanda Y. Chambers, Benjamin D. Cowan, Scott G. He, Douglas J. Klear, Sung H. Lee, Ethan C. Lincoln, Sandip Mehta, Ross F. Metzger, Michael J. Ocasio, Andrew J. Pinard, James J. Raley III, Michael D. Randall, Karl V. Rohrer, David Rozenshtein.
