Business Expects for 1955

Slightly higher investment in plant and equipment....

and substantially increased sales

* ANTICIPATED

DATA: O.B.E. & S.E.C.

U. S. DEPARTMENT OF COMMERCE, OFFICE OF BUSINESS ECONOMICS

65-16-1

BUSINESS activity in January and February extended the rise experienced in the fourth quarter of last year. It is apparent that participation in the advance has broadened. A particularly significant development is the tilting upward of the curve of plant and equipment investment indicated by the 1954 survey detailed in this issue. This, and the general expectation of higher sales reported in the same survey, attest to the confidence of businessmen in the outlook.

The rise in business has been based, as depicted in the chart on page 2, both on the sustained growth of major types of demand which maintained their upward trend throughout the recent readjustment, and on the reversal of other types of demand which largely accounted for the 1954 downturn but which stabilized or advanced in the fourth quarter. Both groups have shown a further upward movement so far this year.

Consumer demand for nondurable goods and services, private construction, purchases of goods and services by State and local governments and, on balance, by foreign countries, are continuing to expand. Demand for durable goods, especially consumer durables, is extending the recovery which began in the final quarter of 1954. Business inventories are reflecting the swing of management policy away from liquidation. Federal purchases are still contracting but at a much slackened rate.

Construction in January and February was well above the same period of 1954, with private residential activity up very substantially. In January, new housing starts were at a seasonally adjusted annual rate of 1.4 million, close to the December high and a rate equal to the peak total attained in 1950.

Durable goods orders

Improvement in the market for durable goods is indicated by the flow of new orders to manufacturers. New business placed with manufacturers of durable goods has continued the expansion from last summer's low. New orders for transportation equipment, which include sales of motor vehicles, accounted for most of the January rise but an expansion in machinery orders was significant as evidence of the upturn in demand for producers' durables. New orders for electrical and nonelectrical machinery were each one-eighth above the monthly average for 1954. New orders for metal cutting machine tools, which were depressed most of last year, participated in the recent upturn. Thus, some of the industries which were still lagging in the fourth quarter have started to move ahead.

Manufacturers' unfilled orders, not adjusted for seasonal variations, expanded by nearly \$1 billion during January to return to the October level. Half of the January increase was in primary and fabricated metals. Unfilled orders for

nonelectrical machinery increased for the first time since mid-1952, although the gain was small. Because of higher sales, the ratio of unfilled orders to sales in the major durable goods industries either showed little change or was reduced over the past 3 months.

Manufacturers' production and sales reflect this improved flow of new business, and industrial employment picked up in February.

Trade active

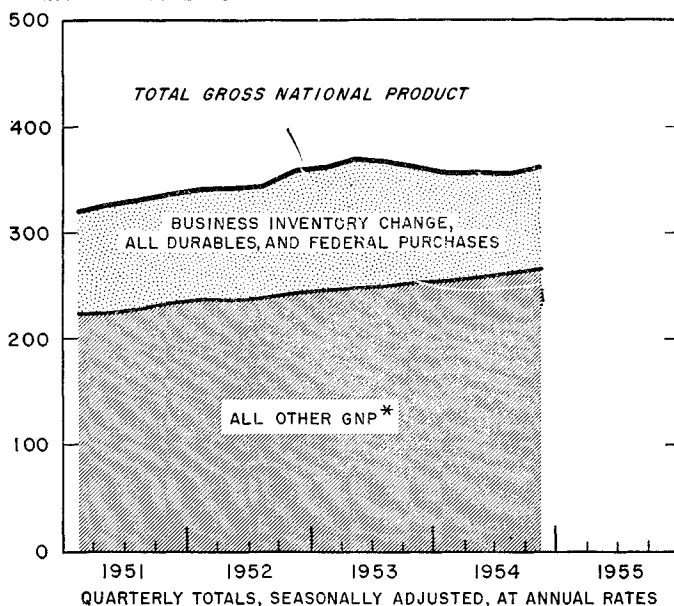

Seasonally adjusted total retail sales according to preliminary advance reports were little changed from January and less than 2 percent below December's very large volume. Combined sales for January and February are about 7 percent ahead of those in the corresponding period of 1954. Sales were spotty, however, as gains at automotive stores were offset by declines at apparel and general merchandise outlets.

Automobiles are leading the way in distribution as well as in manufacturing. The number of new passenger cars sold in February, notwithstanding the short month, exceeded the January total by a sizable margin and almost equaled the December volume. Sales of used cars were also large. Owing to the high rate of factory shipments, the number of new cars in dealers' stocks has increased but is not large in relation to current sales.

Gross National Product

Divergent patterns of major components

BILLIONS OF DOLLARS

* Consumer nondurables and services, new construction, net foreign investment, State and local Government purchases

U. S. DEPARTMENT OF COMMERCE, OFFICE OF BUSINESS ECONOMICS

55-16-2

The active movement of goods and services through retail outlets is based principally on the sustained high level of personal income. That buyers are also making generous use of short- and intermediate-term credit is evidenced by the smaller than usual contraction of consumer credit from December to January. New extensions of instalment credit

in January, after seasonal adjustment, exceeded repayment by \$0.3 billion. Nearly all of the new instalment credit was used to purchase automobiles and other consumer goods

Purchasing power rising

Personal income is maintaining its strong movement, with the January flow, at a seasonally adjusted annual rate of nearly \$291 billion, again slightly bettering the highest month of 1953. Wages and salaries moved up from December and other income types, except dividends, were little changed for the month. The return of dividend declarations to a more normal rate after the spate of extras that gave a temporary boost to the December figure was responsible for a slight reduction in the income total.

Source: U. S. Department of Commerce, Office of Business Economics.

Another factor in the January income change was the movement to a new and higher level of personal contributions for social insurance. Contributions of employees and self-employed persons for social insurance are deducted from income disbursements in calculating personal income. From December through February, the total of such deductions increased by almost one-half billion dollars at an annual rate as a result of permanent legislative changes of three types. Their effect was nearly all felt in January.

Changes in social insurance contributions

The 1954 social security amendments enlarged the area of coverage under the Old Age and Survivors Insurance program to include as of January 1, 1955, the following groups: farm operators; virtually all farm employees; self-employed architects, engineers, accountants, and funeral directors; clergymen; citizens employed abroad by foreign subsidiaries of United States enterprises; industrial homeworkers; and additional employees engaged in fishing, private households, and Federal Government activities. It also permitted, by election, OASI coverage by State and local government employees already members of a government retirement system.

In addition to this expansion of coverage, a second legislative change enlarged the taxable earnings base from \$3,600 to \$4,200, effective January 1.

A liberalized benefit scale for annuitants and their dependents, also a feature of the amendments, became effective in September 1954 and lifted the closing quarter's personal income flow to the extent of \$0.5 billion at an annual rate

The reduction in the January personal income total attributable to these amendments—\$0.3 billion at an annual rate—was restricted solely to employees' income, since payments by the newly covered self-employed are not due until 1956 at the time of filing income tax returns on 1955 income and the effect of the higher earnings base on the group also will not be felt until next year. However, beginning in January, self-employed persons have been paying social security taxes on income at rates increased from last year. The rate increases which became effective at the start of 1954—½ percent for employees and employers (to 2 percent each) and ¼ percent for the self-employed (to 3 percent)—were immediately reflected in withholdings from employee 1954 income, but did not until this year affect payments (on 1954 income) by the self-employed. Thus, a further reduction—approximately \$0.1 billion at an annual rate—in the January personal income flow may be traced to this factor.

Another minor increase in employee contributions for social insurance in February resulted from a recent Executive order granting civil-service status to approximately 450,000 Federal Government employees. Effective January 23, these employees became members of the Federal civilian retirement system, which provides for a 6 percent contribution rate, as compared with the 2 percent rate which was collected under the Old Age and Survivors Insurance system. This rate differential has the effect of increasing personal contributions by about \$0.1 billion a year.

Payrolls still moving up

Wage and salary disbursements at a seasonally adjusted annual rate of \$199 billion in the opening month of the year were more than \$1 billion above the December amount. Since the low point reached last spring there has been a 2 percent increase in this type of income flow, attributable to the combined effects of rising wage and salary rates, a longer workweek, and increased employment, with the quantitative importance of the three factors in that order.

Wage and salary disbursements in the commodity-producing industries, which were reduced most from the summer of 1953 to the spring of 1954, have shown the smallest subsequent percentage increase although since reaching their low point last September their rate of advance has been quite rapid. January wage and salary totals in the distributive, service, and Government industry groups were above their 1953 highs while that for the commodity-producing industries was about 5 percent lower.

Nonagriculture employment recovery

Accompanying the revival in economic activity, employment in nonagricultural industries, after allowance for seasonal variations, has followed an irregularly rising trend since the low point reached last August. Recent changes in employment in individual industries have not closely matched changes in activity in the same industries, however, because of divergent changes in hours worked and productivity.

By February, seasonally adjusted employment in non-agricultural industries including the armed forces was 200 thousand or 0.4 percent above the 51.5 million average of last year's spring quarter. Government employment, including military, was up 1.1 percent during that period, while there was an increase of 0.2 percent in private employment. Federal Government civilian employees were 0.5 percent more numerous in February than last spring but this increase was more than offset by the 4 percent reduction in the military rolls. State and local government employment in February was 5 percent higher than in the spring of 1954—the largest increase for any major groups

shown in table 2. Both school and nonschool employment participated in the rise.

The small increase in private nonagricultural employment was very largely due to moderate expansion in the distributive and service industries (see table 2). In both trade

Nonagricultural Wages and Salaries and Employment

Employees in Nonagricultural Establishments

DATA: B. L. S.
U. S. DEPARTMENT OF COMMERCE, OFFICE OF BUSINESS ECONOMICS 55-16-3

segments employment was about 1 percent higher in February than last spring. Trade employment, seasonally adjusted, has not only recovered earlier losses but has risen to a new high as expansion in the number of trade outlets has accompanied the residential building boom and the

(Continued on page 28)

Investment and Sales

Anticipations in 1955

BUSINESS currently expects its plant and equipment outlays this year to aggregate \$27 billion, slightly above last year and about \$1 billion less than the 1953 record, according to the survey of expectations conducted in February and early March by the Office of Business Economics and the Securities and Exchange Commission. Businessmen also anticipate a higher dollar volume of sales in 1955, averaging about 5 percent above 1954.

Since the movement of capital outlays was slightly downward through 1954 and the first quarter of 1955, the present programs now reported by business indicate an advance from the current level during the coming months of this year.

The investment programs of public utilities and commercial companies, with planned increases of 4 and 7 percent, respectively, are mainly responsible for the projected upturn in investment in 1955, but a number of major manufacturing lines are resuming the uptrend. Furthermore, while manufacturing companies in the aggregate report a total for the full year 3 percent less than in 1954, they expect a rise in expenditures beginning in the second quarter. Both the railroads and mining companies report sizable reductions for the year, but other transportation concerns except another year of high investment.

The survey results for major groups are as follows:

Percent Change in New Plant and Equipment Expenditures, 1954 to 1955

All industries.....	1
Manufacturing.....	-3
Durable-goods industries.....	-4
Nondurable-goods industries.....	-2
Mining.....	-8
Railroads.....	-11
Transportation, other than rail.....	-1
Public utilities.....	4
Commercial and other.....	7

Examination of the survey results by size of firm indicates that very large manufacturers (those with assets over \$50 million) expect little change in capital outlays from 1954 to 1955. Expenditures by this group as a whole have been quite stable since 1953 and have been an important sustaining influence in overall fixed capital investment.

Medium-sized firms (with total assets between \$5 million and \$50 million) also expect to maintain 1954 rates of investment this year, in contrast to last year when they reduced their expenditures. Manufacturers with less than \$5 million of assets anticipate some decline during 1955, but in general the plans of such firms are less certain than those of the larger concerns and have a higher degree of flexibility.

NOTE.—MR. FOSS IS A MEMBER OF THE BUSINESS STRUCTURE DIVISION, OFFICE OF BUSINESS ECONOMICS.

According to the quarterly information collected in this survey, business anticipates that the current quarter will represent the low point of the comparatively mild downturn in fixed business investment which has been in progress since the third quarter of 1953. Outlays are scheduled at a seasonally adjusted annual rate of \$26 billion in the first three months of this year and are expected to advance to \$27½ billion in the following quarter. This would represent a 1 percent increase over the average in the first quarter and would bring investment back to the rate of the first quarter of 1954.

Plant and Equipment Expenditures

Rise scheduled for second quarter

* ANTICIPATED

DATA: O.B.E. & S.E.C.

U. S. DEPARTMENT OF COMMERCE, OFFICE OF BUSINESS ECONOMICS

55-16-5

On the assumption that this year's capital spending goal of \$27 billion is realized there is implicit in the data a seasonally adjusted annual rate in the second half also at \$27½ billion. This pattern suggests that the second quarter gain will be maintained later in the year.

Advances in plant and equipment expenditures from the first to second half of this year are expected by producers of

both durable and nondurable goods, and by public utilities, and nonrail transportation firms. The commercial and mining industries show little change in their spending rates over this period, while only the rails anticipate lower capital outlays.

Recent influences on investment

With the expected upturn in business fixed investment, all major sectors of private demand that moved downward in late 1953 will have reversed that movement. There can be little doubt that the recovery in business sales and earnings since last fall has bolstered business confidence and has had a salutary effect on this year's programs.

In addition to increased earnings, depreciation on the expanding stock of capital has been a rising source of internal funds. It is also quite likely that added investment funds have become available to a number of concerns as a result of the provisions of the 1954 tax law which permit higher depreciation charges on new facilities in their early years of use. Another favorable factor that may be cited is the relatively plentiful supply of investment funds from external sources on comparatively favorable terms. Long-term interest rates, while moderately higher than 6 months ago, are still low. Terms of equity financing are close to the lowest point reached in the postwar period.

Other factors affecting recent and near-term investment trends may be mentioned. While the completion of some Korean expansion programs means a lower rate of expenditure on the federally aided capital outlays, the volume of such expansion is still large. On the other hand, replacement and modernization outlays are being maintained, according to information obtained in the current survey. Finally, long-term growth factors are still at work as a result of the population increase and its shift to outlying areas. These factors are the major stimuli in the expansion in investment in retailing, in communications and in public utilities.

Quarterly trend reversed

Actual figures now available for late 1954 indicate that total capital expenditures fell from a seasonally adjusted annual rate of somewhat under \$27 billion in the third quarter to close to \$26 billion in the fourth. Decreases occurred in manufacturing, mining, railroads and the utilities, while spending by the commercial and nonrail transportation groups was about unchanged. Another small decline is expected in the first three months of this year.

First quarter 1955 investment was off almost 10 percent from the high point in the third quarter of 1953. Of this amount about two-thirds is attributable to the reduced rate of investment in manufacturing facilities. In retrospect it may also be noted how quickly the decline moderated; more than two-thirds of the total decrease occurred in the first half of this 18-month period.

The anticipated 5 percent increase in the second quarter is indicative of a fairly widespread recovery. A rise is expected to take place in both the durable- and nondurable-goods segments of manufacturing, with a somewhat sharper rise in the latter. In public utilities, the gas group reports a pickup in the spring months as a result of new pipeline construction. The commercial group, where the buoyant retail trade programs are predominant, expects the largest relative gain over this period.

Realization of 1954 programs

Anticipated investment in 1954 as reported by business in our annual survey a year ago was close to the amount actually spent, as has been the case in most years since the end of

World War II. Actual expenditures declined 5 percent from 1953 to 1954, as compared with an anticipated reduction of 4 percent. Viewed on the whole, the forecasting value of the initial survey was very good.

Manufacturing companies in the aggregate reduced their capital spending about as much as their estimate—7 percent—but some other major groups did not spend quite so much in 1954 as expected early last year. The railroads scheduled a decrease of 28 percent but actually reduced outlays by 35 percent. Public utilities planned a decline of almost 3 percent but actually cut their expenditures by 7

Business Capital Outlays by Major Industry Categories

* ANTICIPATED

DATA: O.B.E. 8 SEC.

U. S. DEPARTMENT OF COMMERCE, OFFICE OF BUSINESS ECONOMICS

55-16-4

percent, greater relative deviation occurring in gas than in the electric utilities. The mining industry, which was expecting a small increase in its fixed investment rate from 1953, experienced a small decrease. The commercial and nonrail transportation industries, on the other hand, both slightly exceeded their initial expectations.

Comparison of actual and anticipated expenditures by manufacturing industries in 1954 indicates that most industry groups correctly projected the trend in their capital outlays. However, there was a tendency—offsetting in the total—for anticipations of durable-goods producers to underestimate both the relative increases and decreases in investment.

Producers of primary metals and nonelectrical machinery, for example, reduced their capital outlays more than indicated by their early 1954 plans, while automobile and other transportation companies made larger increases than expected. The electrical machinery group experienced a decline, in contrast to an earlier anticipation of little change. In the nondurable-goods field spending by petroleum, rubber and chemical firms fell somewhat short of plans, in contrast to the food and beverage, textile and paper industries, where plans were exceeded.

With respect to size groups, there was a tendency for the largest-size group to spend somewhat less than anticipated. Although, as already noted, actual spending was little changed from 1953. Expenditures by small and medium-sized companies in 1954 exceeded earlier anticipations. The latter phenomenon has been observed for the smallest concerns in earlier surveys and is probably a characteristic of firms in which investment budgeting is not widely practiced.

Manufacturing investment

According to the present survey, manufacturers expect to spend \$10¼ billion for new productive facilities in 1955. This compares with actual outlays of \$12 billion and \$11 billion, respectively, in 1953 and 1954. Durable-goods producers expect a 4 percent decline in investment from 1954 to 1955, while nondurable-goods producers anticipate spending 2 percent less.

In the durable goods field investment trends of major industries diverge considerably and many reversals of trend may be noted. Automobile producers are now reducing outlays after the sharp spurt in their programs in late 1953 and in 1954. In contrast, industries that declined last year—iron and steel, nonferrous metals, and machinery except electrical—are expecting increased outlays in 1955, more in the former industries than in the machinery groups. Producers of transportation equipment other than automobiles are also planning to spend more than last year.

In the nondurable goods area the pattern more nearly resembles last year's changes with a few important exceptions. The petroleum industry, the only major industry that has continually increased annual capital outlays since 1949, is planning another small increase. Food and beverages and textiles expect their expenditures to fall again, the latter for the fourth successive year. The chemical and paper industries expect their investment to be about the same as in 1954 while rubber manufacturers foresee a small increase in their spending. Programs of both the chemical and rubber industries were cut sizably last year.

Replacement and expansion

In this year's annual survey companies were requested to segregate their total plant and equipment expenditures in 1954 and 1955 between outlays for replacement and modernization and those for expansion.¹ Because of the nature of the question and the difficulty of precisely defining these categories the data and conclusions presented here should be considered very tentative.

For all manufacturing industries combined, replacement and modernization expenditures were just over three-fifths and expansion close to two-fifths of total plant and equipment expenditures in 1954. The great majority of major industries indicated that replacement and modernization expenditures accounted for between one-half and two-thirds of their aggregate outlays. The chemical industry reported the lowest proportion of 1954 outlays for replacement and the highest for expansion while the opposite was true for textiles.

The survey reveals that from 1954 to 1955 manufacturers as a whole expect to maintain their outlays for replacement and reduce their outlays for expansion by about 4 percent. This pattern is essentially the same for both the durable-goods and the nondurable-goods groups.

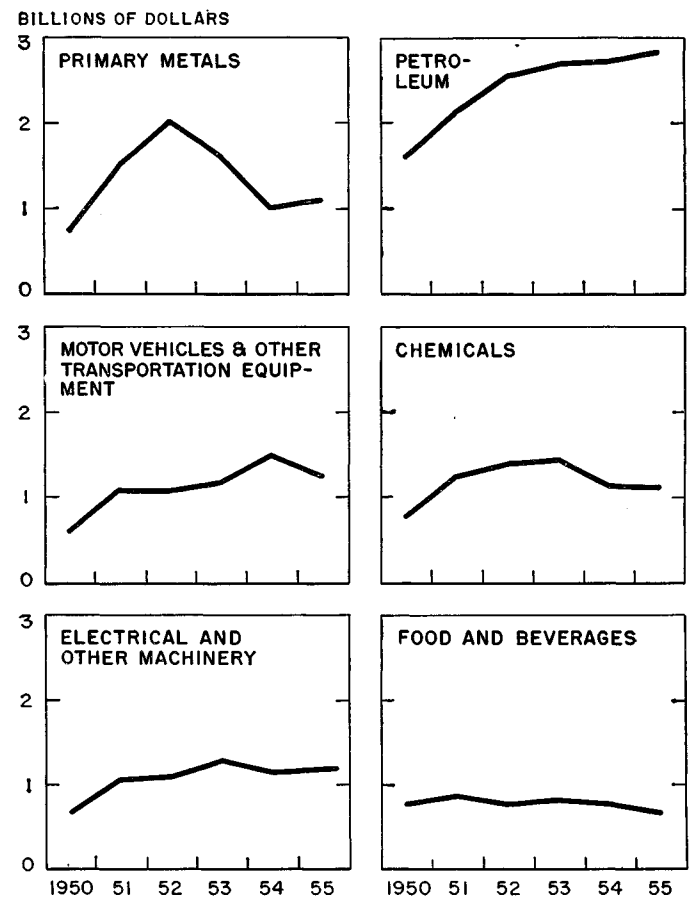

1. Replacement and modernization expenditures in this survey generally refer to outlays made primarily to replace worn out, obsolete or less economical plant and equipment already owned by the firm. Expansion outlays generally refer to capital outlays that primarily add to rather than replace the company's production, distribution, transportation, administrative and general facilities. Respondents were given considerable leeway in answering the question since it was recognized that the division between the two types of expenditures might not be well defined in a number of instances.

When more detailed industries are examined, it appears that for industries in which increased outlays are anticipated from 1954 to 1955, expansion outlays are almost always expected to advance, while replacement outlays are being either maintained or increased. Industries with anticipated decreases in investment in most cases show planned reductions in both replacement and expansion expenditures.

The 1953-54 manufacturing decline

Although the survey indicates that manufacturing outlays in 1955 as a whole will be slightly lower than they were last year, of greater significance is the anticipated recovery in manufacturing investment following the first quarter of the present year. The manufacturing drop will have lasted two

Manufacturing Investment Programs

DATA: O.B.E. & S.E.C.

U. S. DEPARTMENT OF COMMERCE, OFFICE OF BUSINESS ECONOMICS

55-16-6

full years—on the assumption that the current plans are realized—but the reduction has not been of large proportions and thus has not exerted a serious deflationary effect on economic activity. The recent reduction may be compared with the downturn that occurred in the 1948-50 period, when over a comparable 8-quarter span manufacturing investment fell approximately one-third, or twice as much as it did recently.

The moderate character of the recent decline may be partly explained by the fact that investment cycles of the various industries have not coincided in their timing. Thus the primary metals industries, which reached their mobilization

peak in 1952, were a significant contributing factor in the decline in durable goods investment from 1953-54. The impact of this drop on aggregate investment was moderated to a considerable extent by the sharp increase last year in outlays by automobile producers, whose expenditures in the mobilization years, 1951-53, had undergone comparatively little change.

As a result of such divergent movements, the net decline in durable goods investment from the peak in the first quarter of 1953 to the indicated trough in the first quarter of this year will have amounted to 20 percent. This may be compared with a one-third decrease in durable manufacturing investment between the third quarter of 1948 and the fourth quarter of 1949, a period that witnessed a drop in capital outlays in virtually every major manufacturing industry.

Nonmanufacturing

Last year nonmanufacturing investment fell by less than 4 percent from the previous year, as a rise by the commercial group partially offset the sharp drop in railroad expenditures and the much smaller relative declines in utilities, mining and other transportation. This year's survey reveals a resumption of the rise in nonmanufacturing, sizable gains in the commercial industries being augmented by a slight increase in the programs of utilities.

Utilities expect rise

The public utilities expect to spend \$4.4 billion for new plant and equipment in 1955, a 4 percent increase from last year. Expenditures for the group are anticipated to show a rising trend throughout 1955, attributable to higher investment in natural gas transmission lines. The electric companies expect little change from 1954.

Since the end of 1950 the utilities have made net additions of 25 million kw.-hr. to their capacity, a rise of almost 50 percent. According to trade reports, outlays for electric generating facilities in 1955 are expected to decline for the second successive year, while higher outlays are being scheduled for transmission and distribution facilities. Outlays for distribution facilities, though rising, are still lower than they were in 1949.

Railroads plan further cuts

During the coming year a further reduction of about 11 percent is being planned by the railroads. This will bring rail expenditures to about \$¼ billion, well below spending rates in other postwar years. The drop is smaller than that from 1953 to 1954, when outlays were reduced by almost one-half billion dollars. Over that period installations of diesel locomotives were reduced almost one-half while freight car installations declined even more relatively. For the first time since 1950 more freight car capacity was retired than purchased. Outlays for passenger cars were maintained but expenditures for roadways and structures declined one-fifth.

Commercial strong

The most buoyant area of investment in the coming year is in the commercial field, where trade firms particularly and communications companies to a lesser extent are planning increases over 1954 spending.² The boom in invest-

ment by the former group reflects the high rate of activity by food, general merchandise, apparel and drug firms in opening stores in new shopping centers, as well as their extensive modernization programs for stores in established communities. All size groups expect an increased rate of expansion in 1955. The very largest organizations anticipate a somewhat smaller relative rise than do the smaller size groups probably because of the sustained high level of their investment in recent years.

Sales Anticipations

The 1955 sales anticipations collected in this survey indicate that businessmen over a wide range of industries are looking forward to higher sales this year. Advances are being projected in manufacturing, wholesale and retail trade, and gas and electric utilities. The largest relative increase among the major industrial groups is the 8 percent rise expected by the public utilities.

3. Includes rubber, tobacco, apparel, printing and publishing, and leather.

Source: U. S. Department of Commerce, Office of Business Economics, and Securities and Exchange Commission.

All major manufacturing industries are projecting sales increases during the coming year. The durable-goods group foresees a rise of 5 percent, and nondurables, an advance of 4 percent over 1954. When the current rates of sales are compared with these sales projections, the implications for the remainder of this year are for the maintenance of durable-goods sales at the improved rate reached in the fourth quarter of 1954, and for a further increase in the case of nondurables.

The primary metals industries, which declined most last year in the durable-goods field, expect the largest relative gain this year—10 percent, with the expectations of nonferrous metals producers somewhat higher than those of steel companies. Machinery companies expect a somewhat smaller advance than the durable-goods average, possibly reflecting the fact that for industry generally investment outlays this year are expected to be only slightly above 1954.

In nondurables projected sales increases fall within a comparatively narrow range. Somewhat larger-than-average increases are expected by the chemicals and textiles industries while the petroleum and rubber industries anticipate less-than-average gains. (See table.)

2. This year for the first time direct information was obtained by the Office of Business Economics on capital spending plans of retail firms not registered with the Securities and Exchange Commission. This supplements the data supplied by trade firms registered with the SEC. The new sample covers retail firms with one or more employees—corporate as well as noncorporate, and chain as well as independent stores.

Projected vs. realized sales in 1954

Manufacturers' sales appraisals for 1954 as reported in the survey a year ago were quite close in the aggregate to actual sales. The trend was correctly indicated, but the drop of 5 percent from 1953 was somewhat larger than the 3 percent forecast.

In durable-goods manufacturing, shipments decreased 11 percent over the year as against a projected 8 percent, while in nondurable goods the respective changes were rises of 1 percent and 3 percent. Actual sales fell somewhat short of projections in most hard-goods lines—the stone, clay and glass industry proving the only exception, with a small increase instead of a decrease. There were large deviations in the steel and nonferrous metals industries.

In nondurables, discrepancies between actual and anticipated sales were less pronounced than in durables. Sales in the food and beverages and chemicals industries came close to realization. Textile sales fell somewhat more and petroleum sales rose somewhat less than anticipated. Sales of the rubber industry were off sharply from their projection of a

small drop, while paper companies exceeded sales projection slightly.

A comparison of last year's plans and results points to significant correlation between actual and anticipated investment and sales. Iron and steel, nonferrous metals, electrical and other machinery, chemicals, petroleum and rubber had either larger sales declines or smaller sales increases than expected, and also invested less than anticipated. Similarly the industries with higher than projected sales, such as stone and paper, invested more than planned. This suggests that deviations from sales expectations last year caused many industries to adjust their investment programs in the same direction.

The major exception was the transportation equipment industry, where investment considerably exceeded plans even though sales fell a little short of expectations. Here the major factor was the large-scale model changes in the automobile industry. This change in product has had a very considerable favorable effect upon the market for cars, as has been pointed out in recent issues of our monthly business analyses. It is a good example of the effects upon the general business situation of autonomous management decisions.

The United States Balance of Payments in 1954

THE principal recent influence upon the exchange of goods and services between the United States and foreign countries has been the continued rise in industrial production abroad, particularly in Western Europe. High domestic demand which in some cases approached the available capacity in these countries stimulated their imports while preventing exports from rising proportionally. The resulting changes in the international accounts led to reductions in the rate of accumulation of gold and foreign exchange reserves, and in the early months of 1955, even to some declines in reserve holdings. The credit restrictions adopted by the United Kingdom at the end of February were a result of these developments and were intended to correct them.

In contrast, the domestic business activity during the last quarter of 1954 was in the early stage of the current rise and bottlenecks to the expansion of production had not developed. These differences in the relative supply situations here and abroad contributed to the fact that the United States balance of payments up to the end of the year was little affected by the change in domestic business.

Exports rise sharply—Imports lag

Although domestic demands in the United States have risen substantially, it has been possible for our exports to increase also. More than half of the \$600 million rise in nonmilitary exports in the fourth quarter may be attributed to other than seasonal factors. A substantial part of the export rise consisted of foodstuffs and agricultural raw materials, but there was also a considerable increase in industrial goods including steel, fuels and chemicals for which the export demand had to compete with the rising domestic demand.

The \$120 million rise in merchandise import values from the third to the fourth quarter was due mainly to larger imports of coffee, fuel oil, newsprint, whiskey, and tobacco. To a large extent this rise was seasonal. The value of coffee imports was affected by a decline in average unit values from 76 cents per pound in the third quarter to 64 cents in the fourth.

Imports of the major raw materials such as wool and most of the metals declined. Rubber imports also fell in volume, but because of higher prices rose slightly in value.

For many of these raw materials such as rubber and copper the rise in foreign demand has led to price rises which encouraged the expansion of domestic production and, in the case of wool, the greater use of synthetics and domestic supplies. In addition, inventories of some materials were drawn down thus postponing the effects of rising domestic demands upon imports.

The United States export balance on goods and services, excluding military end-items exported under grant-aid programs, rose to more than \$900 million, the highest amount for the fourth quarter since 1951. At that earlier time

exports were stimulated by the high foreign incomes following the outbreak of hostilities in Korea, while United States imports were held down by the liquidation of inventories accumulated earlier in that year. The high export balance during the fourth quarter of 1954 was made possible mainly by increased grants and private capital outflows.

More grants of surplus farm products

The rise in nonmilitary grants in 1954 consisted largely of emergency food relief grants, donations of agricultural surplus goods distributed abroad through private relief organizations. There was also a large cash payment to Vietnam for relief and resettlement of refugees.

Payments to France for military expenses in Southeast Asia dropped from \$136 million in the third quarter to \$89 million in the fourth but dollar payments to assist the United Kingdom in the production of military aircraft rose during the same period from \$6 million to \$26 million.

Commercial credits expand

The outflow of private capital—according to preliminary estimates—expanded substantially in the final quarter of 1954, largely because of higher medium term bank loans to Latin America. Portfolio investments were also increased by a \$25 million issue of Australian bonds of which about three-fourths was purchased by United States investors. Proceeds of a Belgian bond issue were transferred after the close of the year and are, therefore, not included in the fourth quarter figures. These issues were the first foreign bonds, except for those sold by Canada and the International Bank, to be publicly offered in the United States since 1947.

The revival in the market for such securities indicates the rising confidence in the economic and monetary stability of the borrowing countries and the general area with which they are economically connected. The bank loans to Latin America, however, were very largely secured by gold and United States Government securities and reflect rather a weakness in the balance of payments of the debtors due to high import demands and marketing difficulties for their main export commodities.

Equally divergent factors accounted also for the continued large outflow of short-term capital. In part, the capital flow went to such relatively strong countries, as Germany, Venezuela, Mexico and the United Kingdom, and in part it includes increased claims against countries which were affected by the decline in coffee prices.

Foreign debts offset rise in dollar assets

Some of the rise in United States assets abroad can be attributed to the increased usefulness of foreign currencies for international payments and to higher yields on short-term funds held abroad. A large part of the credits, particularly to some of the Latin American countries, should

NOTE.—MR. LEDERER IS A MEMBER OF THE BALANCE OF PAYMENTS DIVISION, OFFICE OF BUSINESS ECONOMICS.

be considered a substitution for drawings by foreign countries on their reserves, however. Although foreign gold and dollar assets rose during the fourth quarter of 1954 through transactions with the United States by nearly \$400 million, about the same amount as during the last quarter of 1953, the increase after allowing for the emergency credits was considerably less.

The Year 1954

For the year 1954 as a whole, foreign receipts from United States imports of goods and services, Government grants (excluding those of military end items) and capital, and private United States capital and donations amounted to about \$19.4 billion. Of this amount \$17.6 billion was spent on goods and services here and \$1.7 billion was added to foreign reserves or other dollar assets.

Government expenditures sustain exports

Of the total foreign receipts, about \$5.3 billion represented foreign expenditures by the United States Government (including purchases for the strategic stockpile), and about \$700 million consisted of short and medium term commercial credits. These data indicate the extent to which the high value of exports which was reached during the year, depended upon the dollar outflow from these sources.

Net payments to Europe decline

Transactions with Western Europe through the exchange of goods and services, Government grants and loans, and private United States capital movements and remittances resulted in an excess of payments by the United States over receipts of about \$1.2 billion in 1954 as compared with about \$1.65 billion in 1953. Transactions with the United Kingdom and the other sterling area countries in Europe accounted for

^p Preliminary. ^r Revised. ^{*} Less than \$500,000.

1. Includes loans and returns of military equipment.

Note.—Data for previous years may be found in the Balance of Payments 1919-53 supple-

ment to the SURVEY OF CURRENT BUSINESS. Net foreign investments equal the balance on goods, services, and unilateral transfers for all areas: 1953 year: -1866; 1954 year: -336; 1954 I, -306; 1954 II, +14; 1954 III, -354; 1954 IV, +310.

net payments by the United States of about \$440 million in 1953 and of \$315 million in 1954. The balance with the continental European countries changed from net payments of about \$1.2 billion in 1953 to net payments of about \$900 million in 1954. The latter change can be attributed to the \$480 million rise in United States exports of goods and services (excluding transfers of military end-items) and changes in the movements of private United States capital. The decline in merchandise imports was offset by a rise in military, travel, and other services expenditures.

The export rise to Western Europe, including the United Kingdom, most of which took place during the second half of the year, must in part be attributed to the relaxation of European exchange restrictions made possible by the rise in gold and dollar reserves. Most of the increase consisted, however, of raw materials and foodstuffs other than grains, a reflection of the rising industrial production and incomes. Exports of finished manufactures were less affected. In

1954 they comprised perhaps less than one-third of our exports to that area. This corresponds approximately to the prewar pattern of trade which was temporarily changed during the immediate postwar reconstruction period.

The decline in merchandise imports from Europe was to a large extent due to smaller imports of semimanufactured steel products and other raw materials. This reduction is attributable to the rise in European demand as well as the decline in our own. In fact, for many of these commodities, including steel, exports to Europe rose, while imports from Europe declined.

The \$270 million increase in military expenditures was almost entirely due to increased payments for offshore procurement of military equipment for retransfer under military grant-aid programs.

Omitting transfers of military end-items, grants and loans dropped by nearly \$200 million, although cash assistance to

France and the United Kingdom to meet military expenditures rose to about \$360 million.

Net dollar flow to Europe concentrated

The rise in direct military expenditures and the growing emphasis in grants to assist in meeting defense expenditures concentrated United States Government expenditures in Europe in relatively few countries. Although these countries were thus able to purchase here more than they sold, United States Government expenditures there were far greater than their trade deficit. Government payments to Germany exceeded the German merchandise trade deficit with the United States by about \$80 million; for France the corresponding figure was about \$600 million and for the United Kingdom about \$130 million. Private services transactions and remittances further increased net payments by the United States.

The net dollar flow to Europe thus entered the area mostly by way of France and was distributed among the other European countries through settlements of the French deficits through the facilities of the European Payments Union. After the middle of 1954 French transactions with EPU countries were nearly in balance, so that with the exception of special settlements of previously accumulated debts the indirect dollar flow to other European countries was substantially reduced.

Dollar flow interrupted

The limitations on greater purchases of American manufactures by Europe and the size and direction of United States Government expenditures in that area contributed to the continued excess of United States payments to Europe over European expenditures in the United States. In 1954 this excess amounted to about \$1.2 billion, all of which was added to European reserves. Total European dollar assets, including long-term investments in the United States increased by about \$250 million more, and nearly \$200 million were used by European countries to reduce their obligations to the International Bank and the International Monetary Fund. For the year as a whole, net dollar payments by Europe to third areas, particularly Canada and the independent sterling area, were thus more than offset by net receipts from third areas, mainly the dependencies and various Far Eastern countries.

The rise in European gold and dollar assets has greatly contributed to the financial strength of most of the European countries and facilitated the simultaneous rise in production and relaxation of controls on international transactions in that area during the year.

Rising European imports reduced the rate of net receipts from areas other than the United States during the second half of the year below those during the first half of 1954 or the second half of 1953, but did not result in a net dollar flow from Europe to other areas.

A net dollar flow from Europe to other areas, and from there back to the United States as payment for United States exports (mostly of manufactured goods, and services) would require a considerable change in the traditional pattern of world trade and investments. Even before the war net dollar receipts by Europe from the dependencies, the Far East and some of the Latin American countries were more or less offset by net payments to Canada and other parts of Latin America, while United States transactions with Europe were approximately in balance.

In appraising the desirability of such basic changes in the world payments pattern, it must be considered that some of the payments to Europe are temporary, particularly off-shore

procurement under military grant aid programs and direct assistance to meet military expenditures which together amounted to more than \$900 million in 1954. The additions of these dollar payments to European reserves, therefore, appear to have aided world trade by avoiding temporary disturbances.

Latin America

Transactions with Latin America with respect to goods, services, unilateral transfers, and direct investments resulted in net receipts by the United States of nearly \$400 million in 1954 as compared with net payments by the United States of \$50 million in 1953. About two-thirds of the change was due to higher purchases by Latin American countries in the United States and one-third to reduced purchases by the United States. The deficit was met mainly by long and short term United States loans which increased from \$90 million in 1953 to \$420 million in 1954.

Largely as a result of continued net dollar receipts from other sources, including the International Monetary Fund and the International Bank, gold and dollar holdings of Latin American countries rose further in 1954, but at a considerably slower rate than during the previous year.

United States exports to Latin America rose sharply in the first half of the year in response to higher incomes resulting from higher coffee prices and did not drop during the second half of the year, although incomes from coffee sales was greatly reduced. Consequently, the reserves of these countries were under pressure during the latter part of the year.

Canada

Transactions with Canada in 1954 resulted in a reduced export balance on goods and services as compared with the previous year. As other transactions with the United States and net dollar receipts from third countries were relatively stable, Canadian holdings of United States dollars increased, particularly toward the end of the year. Increased holdings of United States dollars held down the appreciation of the Canadian currency which was causing difficulties for Canadian industry both in the domestic and export markets. In order to slow down the inflow of United States capital to Canada, and lower the exchange rate, thus stimulating domestic production, the Canadian discount rate was reduced to 1½ percent in February of this year, the same rate as in the United States. The reduction of the Canadian interest rate will reduce Canadian borrowing in the United States but is less likely to impede the outflow of direct investment capital.

Asia

The United States export surplus on goods and services with the independent countries of Asia and Africa increased from 1953 to 1954 by about \$340 million, because of reductions in both raw material imports and military expenditures in the Far East. Interarea transfers indicate, however, that the loss in income by these countries from merchandise trade with the United States was in part compensated by smaller net payments, probably resulting from increased exports, to other areas. Liquidations of reserves by Japan during the first half of the year were changed to accumulations during the second half mainly as a result of monetary policies which reduced imports and greatly stimulated exports.

United States transactions with the independent sterling area countries resulted in a \$90 million rise from 1953 to

1954 in net receipts by the United States which had to be met by an equivalent change from net accumulations to net reductions of the area's dollar holdings. To meet the deficit with the United States, the area as a whole had to depend upon dollar receipts from other countries, mostly the sterling area dollar pool. These transfers, however, remained about as high in 1954 as during the preceding year.

of 1954 is not likely to be sustained. Adjustments in Latin America and controls on excessive business expansion in the United Kingdom would tend to reduce markets for American goods. At the same time expanding demands in this country may also for some commodities tighten the supply situation, and, in fact, restrictions have already been placed upon the export of copper and scrap.

Rise in export balance limited

The various trends affecting our international business suggest that the upswing in exports during the second half

On the other hand, a relaxation of supply stringencies abroad for some of the raw materials imported by us and lower domestic stocks are likely to stimulate United States imports. These changes would result in a decline in the export surplus which may permit net foreign dollar assets to rise faster than during the fourth quarter of 1954.

FAMILY INCOME BRACKETS

Income Distribution in the United States, 1950-53

INCOME of American families was \$272 billion in 1954, or slightly more than the aggregate for 1953. Its stability reflected the various forces, reviewed in previous issues of the SURVEY, that supported the flow of personal income during the recent business readjustment. Because of the reduction in Federal individual income tax rates, income after Federal tax liability increased by \$4 billion over 1953, reaching a total of \$245½ billion.

This represented an average after-tax family income of \$4,820 in 1954. The term family is used to include unattached individuals as well as multiperson families in this article, except where it is necessary to distinguish these two groups. The relative increase over 1953 in average income was smaller than that in total income because of a rise in the

This article brings up-to-date the size distributions of family income that were initiated by the Office of Business Economics in a supplement to the *Survey of Current Business*, "Income Distribution in the United States, by Size, 1944-50." (U. S. Government Printing Office, Washington 25, D. C., 1953, price 65 cents.) It presents revised estimates for 1950 and new estimates for 1951 and 1953. Their derivation is described briefly at the end of the article. For a detailed discussion of definitions and sources and methods, and also for back-year data, the reader is referred to the Income Distribution supplement.

number of family units from 50½ million to almost 51 million. Before-tax average income was \$5,330 in 1954, differing little from 1953.

Taking into account the moderate rise shown by available price indexes for consumer goods and services, it appears that the real after-tax income of the average American family was about the same in the 2 years.

The real purchasing power of the average American family increased steadily over

most of the postwar period through 1953. As compared with 1929, which provides a convenient prewar benchmark, the increase in average real income after Federal income taxes was roughly 30 percent. On a per capita basis, the increase was higher—about 40 percent—since the size of the family was larger 25 years ago than at the present time.

Income Distribution in 1953

The frontispiece and table 1 show the 1953 distribution of American families and of their total income by broad family income brackets. These figures are preliminary. The last comprehensive source material regarding the size distribution of income refers to 1951 and only sample data are available for 1953. Similarly, the estimates of tax liability are tentative. They are extrapolated from 1951 tax return information on the basis of changes in statutory tax rates and estimates of total tax liability derived from tax collections.

1954 distribution similar

Although these estimates apply specifically to 1953, they can be taken as representative also of the broad structure of the consumer market in 1954. This is suggested by the similarity of the income figures for the 2 years, both on an aggregate and average basis, and by the stability in the relative distribution of income throughout the postwar period, which is one of the major findings of this report. However, the impact of the Federal income tax was somewhat smaller in 1954 than in 1953 because of reductions averaging about 10

percent in statutory tax rates and because of revisions introduced in the Internal Revenue Code of 1954.

The bars in the bottom section of the chart show the number of families in each income range. The concentration of families is heaviest in the middle income ranges, although a considerable number are to be found also in the lower income groups.

The largest number of families are in the \$3,000 to \$4,000 bracket. The \$4,000 to \$5,000 range included the average (median) family income, estimated at \$4,410 in 1953; half of the families had incomes below and half incomes above this amount. The income range between \$5,000 and \$6,000 included the average (mean) income of \$5,370.

Each of these three groups contained about 7 million families. Thus, 21 million, or over 40 percent of the Nation's 50½ million consumer units had incomes from \$3,000 to \$6,000. Almost 30 percent had incomes of \$6,000 or more, and about the same proportion received incomes of less than \$3,000. Certain factors that should be taken into account in evaluating the position of low income groups, such as the preponderance of unattached individuals, will be reviewed later.

As can be seen from the top panel of the chart, the distribution of income was pitched higher on the income scale

NOTE.—SELMA F. GOLDSMITH IS A MEMBER OF THE NATIONAL INCOME DIVISION, OFFICE OF BUSINESS ECONOMICS.

than the distribution of families. The largest amount of income per \$1,000 range was received by the group with incomes between \$5,000 and \$6,000, and a substantial proportion of the income total accrued to the middle income brackets adjacent to this group. The chart shows concentration of incomes also in the upper income ranges; these, of course, accounted for a much larger proportion of the total consumer market in terms of incomes than in terms of the number of families.

Impact of income tax

Because of taxation, the distribution of purchasing power differed from the distribution of before-tax incomes. In this report allowance has been made for the impact of the Federal individual income tax, which was the most important factor in this connection.

In 1953, total Federal individual income tax liability was about \$30 billion, or 11 percent of before-tax income. Capital gains taxes are excluded from this total because the gains themselves are not part of personal income. A larger than proportionate share of the income tax was paid by the high income groups. For instance, families in the \$15,000 and over income bracket received approximately 15 percent of before-tax income but accounted for about 35 percent of total Federal income tax liability. Effective Federal income tax rates (tax liability expressed as a percent of total before-tax income) increased from a negligible proportion in the low brackets to 25 percent in the \$15,000 and over group.

In the interpretation of these rates several points should be kept in mind. In the first place, the \$15,000 and over group, which is not broken down further for 1953 because of lack of adequate information, represents the combination of income brackets for which the incidence of the Federal income tax is widely different. It is in these brackets that the graduation of this tax is most substantial and units high up on the scale are subject to tax rates that are much heavier than the

Table 1.—Distribution of Families, Family Income, and Federal Income Tax Liability, by Family Income Level in 1953

average for the group. In 1951, for instance, families in the \$50,000 and over group were subject to an effective rate of 40 percent as compared with a rate of 24 percent for the \$15,000 and over group as a whole.

Secondly, personal income is defined to include elements that are not taxable, such as certain types of income in kind and transfer payments; also for various reasons other forms of personal income are not fully reported on income tax re-

turns. Thus, the effective rates on personal income shown here are somewhat lower than those derived directly from tax returns. Further, these effective rates represent averages on the incomes of families differing widely with respect to composition and size and hence with respect to tax liability. Finally, the rates are averages on total income before deductions and exemptions, and not the steeper marginal rates, implicit in these averages, to which increments of income are subject.

For the broad income groups shown, the impact of the Federal income tax modifies the pattern of the before-tax income distribution but does not change its general outline. However, if the \$15,000 and over income group could be broken down further, it would become evident that families in successively higher positions on the income scale experience a marked progressive reduction in their share of total after-tax purchasing power as compared with their share of total before-tax income. In 1951, for example, families in the \$50,000 and over income groups received 3½ percent of total before-tax income but accounted for only 2½ percent of after-tax purchasing power.

Broad income groups

Additional light is thrown on consumer income and purchasing power if the size distribution data are expressed in a manner that serves to summarize the income position of the Nation's families relative to each other. This is done in the accompanying chart in which families have been ranked according to the size of their before-tax income and divided into five groups of equal number. For each group, and also for the top 5 percent, the chart shows its percentage share of total before-tax income, of total Federal individual income tax liability, and of total after-tax income.

Families with incomes under \$2,300 comprised the lowest fifth of consumer units in 1953 and received about 5 percent of total before-tax income. The next two groups also accounted for proportions of before-tax income that were smaller than their relative numbers. The remaining two groups received a larger than proportionate share, with the top fifth accounting for almost 45 percent of the income total.

The graduated character of the Federal individual income tax is shown by this presentation also. The lowest fifth of

consumer units was responsible for 1 percent of total tax liability, in sharp contrast to the top fifth which accounted for 64 percent. The relative payments of the top group would be higher if the portion of the Federal income tax relating to capital gains had been included.

The effect of the Federal income tax can be seen by comparing the proportions of before- and after-tax incomes. For all but the top group, percentage shares of after-tax income were somewhat larger than those of before-tax

income. In contrast the relative share of the top fifth as a whole was reduced moderately as a consequence of the tax.

Within this group the effect of the Federal income tax becomes more marked at successively higher points on the income scale. For instance, the proportion of the top 5 percent of families comprising units with incomes over \$12,100 was reduced from almost 21 to 18 percent, or by one-eighth. Even more substantial reductions are found in yet higher income ranges.

Changes in Income Distribution, 1947-53

Most of the postwar period was characterized by an upswing of money incomes which reflected in part the advance in the price level. From 1947 to 1953 total family income, both on a before- and after-tax basis, rose by almost 50 percent. Average current dollar family income, shown in the accompanying chart, rose by about 30 percent, as the number of families increased one-eighth over the period.

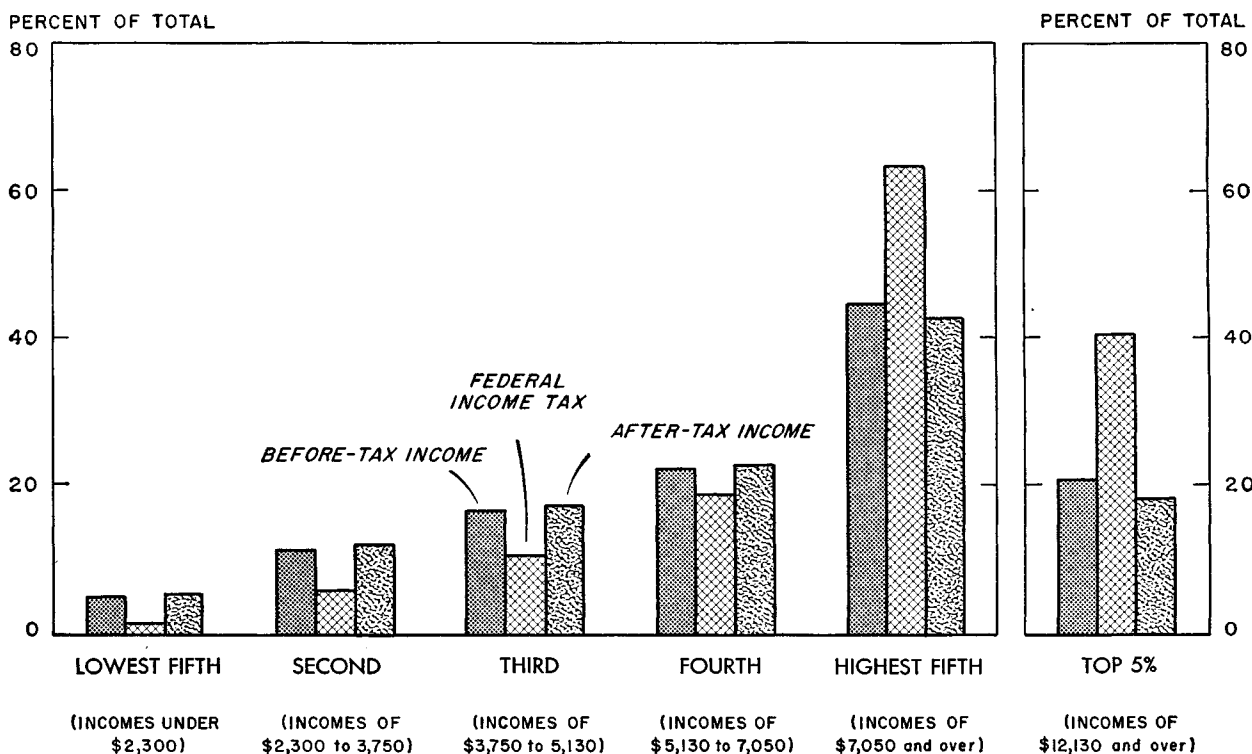

Current dollar incomes

Table 2, which is on a before-tax basis, shows that the 1947-53 increase in income was widely distributed and resulted in a broad shift of families from the income ranges under \$4,000 into higher income brackets, and that a similar

shift occurred also in the distribution of total income. Thus the number of families with incomes of less than \$4,000 decreased by one-fifth. In contrast, the number with incomes over \$4,000 increased by more than 70 percent and the total amount of income in this range increased by more than 80 percent. As a consequence of the general upward shift, the largest amount of income per \$1,000 range was found in the \$5,000 to \$6,000 bracket in 1953, as compared with the \$3,000 to \$4,000 bracket in the 1947 distribution.

In terms of the major types of consumer groups included in the overall distribution, it is found that the upward shift between the two terminal years of the comparison reflected mainly the experience of the nonfarm groups. The income of farm operator families underwent considerable fluctuations

Distribution of Family Income, Federal Income Tax, and After-Tax Income in 1953

during this period, and after reaching very high levels both in 1948 and in 1951 declined thereafter.

Real incomes

Although in part the increase in family income from 1947 to 1953 reflected the rise in prices, the growth of real incomes was also substantial over the period. In terms of aggregate amounts, real income (measured in constant dollars) increased by one-quarter, both on a before- and after-tax basis, and the increase in real income per family was about 10 percent.

It is apparent that an allowance for the changing purchasing power of the dollar would greatly dampen the upward shift of family units and dollar incomes that is shown in table 2. However, the constant dollar figures indicate that there occurred an upward shift on the real income scale also,

although it was more moderate. This increase in the number of relatively well-to-do families is significant from the standpoint of evaluating the structure of consumer demand since changes in patterns of spending are to a large extent dependent on changes in the size of real income.

Relative income changes

The relative extent to which different income groups have shared in the rise of income that occurred in the postwar period is shown in the accompanying chart and in table 3, in which percentage shares of income received by successive fifths of consumer units are given for selected years. The essential stability in shares of before-tax income for the past decade is clearly shown. Only slight shifts are apparent, such as the fractional increase in the relative share of the three middle groups and the correspondingly small reduction in the share of the top fifth. Seen against the background of the major changes in the economy that have occurred since 1944, including demobilization and reconversion, the postwar inflation, and the Korean conflict, the stability of the relative income distribution in this period is a finding of major interest.¹

It should be emphasized that the stability in relative income distribution shown by these figures does not mean that all individual families kept their same relative position on the income scale as incomes increased. New family units were formed and older ones disappeared, and many families that continued throughout the decade shifted their position in relation to one another at the same time as the distribution as a whole shifted upward along with the rise in average incomes.

After-tax relative income shares, shown in the right section of table 3, were also essentially stable from 1950 to 1953. (Corresponding after-tax estimates have not been prepared for earlier years.) Rates of individual income tax have changed over this period, and have resulted in changes in its graduation. These changes, however, have not been large enough to modify significantly the relative impact of the tax on the broad income groups shown in the table, and a more detailed analysis would be necessary to bring out their differential effects.

The relative size distribution of income during the postwar period differs from the patterns observed for the 1930's and 1920's. Comprehensive data for these earlier periods covering all years and all income ranges are not available, but such information as exists indicates that the relative share of the upper income groups has been significantly lower in recent years than in the prewar period.

The reduction has apparently reflected two factors: First, a decrease in the relative importance in the income total of types of income—such as dividends—which accrue in large proportions to the upper income groups; and second, a reduction in dispersion within major income types, particularly wages and salaries. The postwar data show considerable stability in the proportions of the major income types and also in the dispersion of wages and salaries, and are in harmony, therefore, with the stability in the relative size distribution of total family income in this period.

1. The pattern of stability holds also for the nonfarm multiperson family group taken by itself. This distribution differs from the overall distribution mainly in level. The income distribution of nonfarm families is pitched higher on the income scale than that of farm operator families and unattached individuals; the two lowest fifths of nonfarm families receive somewhat higher proportions of the total income accruing to nonfarm families than the corresponding percentages shown in table 3. The two top groups account for somewhat lower shares.

Family Groups and Individuals

The great bulk of the 50½ million consumer units in 1953 consisted of nonfarm families. Comprising all units of two or more persons other than the farm group, they numbered more than 35½ million. Farm operator families—all families operating farms whether tenant- or owner-operators—totaled about 5½ million. This group includes full-time farmers as well as families whose farming operations represented only secondary pursuits. Unattached individuals, consisting of persons not living with relatives, numbered 9½ million. About three-fifths of them lived in their own dwelling units, and the remainder as lodgers or servants in private homes or in boarding houses and hotels.

Summary data relating to these three broad groups are shown in table 4. The nonfarm family group received 84 percent of total income. Its average income was by far the highest—\$6,390 as compared with \$3,460 for farm operator families, and \$2,630 for unattached individuals.

In the light of these averages, it is not surprising to find marked differences in the distribution by income size brackets among the three groups. Table 5 shows the predominance in the lower income ranges of unattached individuals and farm operator families. Of the 8 million consumer units with incomes under \$2,000, 4 million were individuals and 2 million were farm families. Nonfarm families predominated in the middle and upper income ranges. For example, they comprised more than 17 million of the 20 million consumer units in the brackets between \$4,000 and \$7,500, and 8 million of the 8½ million in the range above \$7,500.

The disparity in the three income distributions is shown also by the percentage calculations in table 5. Among nonfarm families only 6 percent are estimated to have had personal incomes under \$2,000, and fewer than 30 percent received incomes under \$4,000. For farm families, the corresponding percentages were 37 and 72, and for individuals

Percent Distribution of Before-Tax Family Income

46 and 83. In contrast, the proportions of nonfarm families in the middle and upper income brackets were much higher than those for farm families and individuals.

Low income groups

These differences among the three component income distributions throw additional light on the significance of the overall data. In particular, they permit a partial evaluation of the economic position of consumer units in the low brackets of the income scale.

Table 3.—Distribution of Before- and After-Tax Family Income, 1944-53

While these brackets include large numbers whose living standards are inadequate, the total number in these brackets may give an exaggerated view of the extent to which this is the case. It is necessary to take account of special characteristics which make the income of many low income recipients an imperfect measure of their actual economic status.

The requirements of individuals, for instance, are smaller than those of typical multiperson families because income is not usually shared with other household members. Also, individuals include large numbers—mostly young persons—who were not in active economic life for all of the year and whose part-year earnings, which are reflected in the statistics, are not an adequate measure of their actual command over goods and services during the year.

The following figures are suggestive of the nature of the correction necessary to allow for differential requirements. In 1953, when income per family (farm and nonfarm) averaged \$6,000, the per capita income of these families was \$1,680 as compared with an average of \$2,630 for individ-

uals. Thus, on a per capita basis, the relative position of families and individuals is actually reversed. Undoubtedly the per capita figures give too favorable an impression of the relative position of individuals since they do not take into account economies of family living, differences in the adult-versus-child composition between the two groups, and the higher rates of taxation to which many individuals are subject. Nevertheless, they indicate that a substantial allowance for differential needs and responsibilities is in order in evaluating the income distribution of this group.

In connection with farm operator families, it should be noted that the 1953 distribution reflects the fact that the average income of the group in that year was below its 1951 peak, although higher than in most others years of the post-war period. (Off-the-farm income is included along with net income from farming in determining family personal income for farm operator families.) Thus relatively more of the farm families were concentrated in the lower income ranges in 1953 than in the peak year 1951. For instance, about 37 percent are estimated to have received incomes below \$2,000 in 1953 as compared with 31 percent in 1951.

More basically, in determining farm family income food and fuel produced and consumed on farms is valued at farm prices, in conformity with the design of the national income accounts. An alternative valuation at retail prices would have added to farm operators' incomes and removed some of the farm units from the low income range.

Table 6.—Family Composition in 1952

Quintile ¹	Average number of—				Percent of families			Median age of family head

1. Families of two or more persons ranked by size of family money income (before income taxes).

Source: Office of Business Economics, U. S. Department of Commerce, based on Census Bureau data.

Furthermore, it is generally agreed that price levels are somewhat lower for rural than for urban families mainly because of differences in the regional distribution of the two groups. If allowance could be made for this factor, the result would also be some reduction in the number of low income farm families relative to that of nonfarm units.

An additional specific factor which should be taken into account is that, on the average, farm families are probably subject to lower effective rates of taxation than the nonfarm groups. More generally, there are such substantial differences between rural and urban modes of living that it is very difficult to make meaningful comparisons of economic status between these groups.

Some of the factors which have been reviewed affect the distribution of nonfarm families also, but their quantitative importance is much smaller. For instance, the presence of part-year earnings affects the interpretation of the nonfarm family distribution, since some young couples that are included in the low ranges of that distribution did not have independent economic status throughout the year. Also, differential needs and responsibilities that have been mentioned in connection with individuals, must be taken into account in the case of multiperson families as well. Information contained in table 6 throws some light on this point.

This table summarizes information on the composition of families in each quintile, derived from sample data collected by the Bureau of the Census in a field survey of 1952 family incomes. Although based on a somewhat different definition of income, broad inferences may be drawn with regard to corresponding fifths of families shown in this study.

Particularly relevant in the present connection are the data relating to the average size of family, the proportion of families without children, and the age of the family head. It can be seen that the average family size is substantially smaller in the lowest fifth than higher on the income scale; that the proportion of families without any children is largest in the bottom group; and that the average age of the family

head is also largest in that fifth. All these facts make it reasonable to infer that family needs and responsibilities were smaller on the average among the low income groups than in the higher income ranges, and that the distribution of multiperson family incomes, as well as that of unattached individuals, should be interpreted with this in mind.

The prevalence of aged couples in the bottom group draws attention to another factor which is relevant in the case of individuals as well. The economic status of retired people is not always measured comprehensively by their current income because they plan as a matter of course to supplement such income by accumulated savings.

Furthermore, there is considerable turnover in the low income groups, both among multiperson families and individuals. This turnover reflects on the one hand such factors as temporary sickness, unemployment and business loss, and, on the other hand, the passing up and down the income scale that is part of the normal economic life-cycle of the typical family unit.

Top income groups

In general, turnover of this type causes a wider dispersion of incomes measured on an annual basis than would be shown by an income distribution in which income receipts were summed over a number of consecutive years. Thus, the number of families in the higher, as well as in the lower, income ranges in any given year is composed partly of units that are located there only temporarily.

In the interpretation of the statistics for upper income groups other characteristics of the income definition should be kept in mind as well. Most important, perhaps, is the fact that capital gains and losses are not counted as part of personal income, and that the earnings of stockholders are measured by their dividend receipts, without taking into account changes in their share of undistributed corporate earnings.

Technical Note

The main source materials on which the estimates of income size distribution are based are the statistics from Federal individual income tax returns prepared in summary form by the Internal Revenue Service, and the sample data on family incomes collected in annual field surveys of the Bureau of the Census and the Federal Reserve Board. The income size distribution series presented here for the period through 1951 were derived by a systematic combination of these two sets of statistics. As part of the integration procedure the basic data were adjusted so that the totals for the various types of income—wages and salaries, noncorporate business income, dividends, etc.—would agree with the independently estimated totals included in the Office of Business Economics aggregate personal income series.

A detailed description of the methods of combining and adjusting the tax return and sample survey statistics to derive the income distribution estimates for 1944-47 is included in "Income Distribution in the United States, by Size, 1944-50" (U. S. Government Printing Office, Washington 25, D. C., 1953, price 65 cents.)² The following descrip-

tion relates to the estimates of income size distribution for later years.

Before-tax distributions for 1950 and 1951

As described in the Income Distribution supplement, the basic procedure used to derive income size distribution estimates for nonfarm families and unattached individuals for 1944-47 involved the following main steps: (1) The derivation from consolidated Federal individual income tax returns of a distribution of individual earners by size of their wage-salary or nonfarm entrepreneurial earnings; (2) the combination of these individual earners into family units classified by size of family earnings, based on relationships between individual and family earnings determined from the Census Bureau sample survey data; and (3) the addition of other types of income to family earnings to obtain the distribution of nonfarm families by family personal income level.

For 1950 and 1951, a somewhat different integration of the source material was suggested by two considerations. In the first place, the split-income provision introduced for Federal income tax returns in 1948 led to a sizable increase in the number of two-income joint returns of husbands and wives which would require separation under step (1); many couples formerly filing two separate returns reported their combined income on a joint return once the split-income

2. It may be noted that revisions have not been made in the 1944-47 size distribution series to incorporate the revised estimates for these years of aggregate personal income and its component income types that have been prepared subsequent to the Income Distribution supplement. Most of these revisions were small and in view of the detailed statistical procedures in constructing size distributions and the minor changes that could be anticipated, it did not seem worthwhile to revise the distribution series for this period. The largest revisions applied to the net farm income totals for 1946 and 1947 which were reduced by about \$1 billion. Thus the size distribution series overstates somewhat the economic status of farmers in these two years. For other types of income the revisions were much smaller, and for total family personal income they did not exceed \$500 million or less than 0.3 percent of the total.

provision went into effect. In view of the lack of adequate up-to-date information for separating these returns a methodology which would omit this step seemed in order.

A second reason for amending the earlier procedure was the lack of current sample survey data on the relationships between individual earner distributions and family earnings distributions, such as were used in step (2) of the 1944-47 procedure. The latest Census Bureau sample data that included the necessary cross-classification of these earnings statistics referred to 1946. However, more nearly current data providing a bridge between tax returns and families classified by levels of total income (i. e., including dividends, interest, rents and other types of income in addition to earnings) were available from the Census Bureau samples. This suggested a methodology in which tax returns would be converted into family units at a stage where the former were classified not by levels of earnings as in the earlier methodology, but by levels of total income.

The following is a summary of the major steps for deriving the nonfarm family income distributions for 1950 and 1951.

First, Federal individual income tax returns in each year, classified by adjusted gross income brackets in the tabulations available from the Internal Revenue Service (IRS), were shifted to brackets representing income exclusive of net capital gains. The shifting of returns reporting such gains (and of their incomes exclusive of such gains) was based on IRS tabulations for the two years which showed these returns cross-classified by adjusted gross income brackets and by net capital gain brackets.³ In the shifting procedure four major groups of returns distinguished in the IRS tabulations were treated separately: joint returns of husbands and wives, separate returns of husbands, separate returns of wives, and single returns.

Second, the returns were combined into family units. Incomes reported on separate returns of husbands and wives—a relatively small group in this period—were combined on the basis of an estimated cross-distribution in which the husbands were classified by size of their own income and cross-classified by size of the wife's income. The main combination step, however, was the addition of the income of supplementary family income recipients (other than wives) to that of heads (including husband-wife combinations).

The combination was accomplished mainly on the basis of an unpublished Census Bureau study in which the 1949 Federal individual income tax returns filed by a sample of family members that were included in the Census Bureau's field survey of family incomes for that year were tabulated. These tabulations (a) provided distributions of family heads (or husband-wife combinations), and of supplementary income recipients, by size classes of income reported on their income tax returns, with each group further classified by the number of income recipients in the family of which they were a part, and (b) cross-classified the supplementary income recipients in each income bracket by size of the income of the family head (or husband-wife combination) reported on tax returns. On the basis of (a), returns in each bracket of adjusted gross income less capital gain were subdivided into the following eight groups: heads of families (or husband-wife combinations) with 0, 1, 2, or 3 or more supplementary income recipients; supplementary income recipients in families with 1, 2, or 3 or more such recipients; and unattached individuals.

For families with no supplementary income recipients—by far the largest group—and for unattached individuals, the distributions required no combination. For families with

one supplementary income recipient, the incomes of family heads (or husband-wife combinations) were combined with the incomes of supplementary recipients on the basis of the information under (b). For the relatively small groups of families with two or more supplementary income recipients, where the sample data were too scanty to provide adequate cross-tabulations, the individual income recipients were combined into family units by procedures similar to those used in earlier years for combining individual earners into families, as described on page 51 of the Income Distribution supplement. A combined all-family distribution was then obtained by adding the distributions for the various number-of-income-recipient groups.

The third step was to subtract farm operator families included in the tax-return-based all-family distribution. Estimates of the numbers and amounts of income to be subtracted in each income bracket (including amounts from nonfarm sources as well as reported net farm income) were derived from IRS tabulations of tax returns reporting proprietorship income in the farming industry and sample statistics giving source patterns of income for farm operators in various income brackets. As described in the Income Distribution supplement, the size distribution series for the farm group, unlike that for nonfarm families, is not based on tax return data.

Finally, the nonfarm family distribution in each year was adjusted to add families not filing tax returns and types of income not covered on returns, and also to adjust reported amounts of income so as to agree with the control totals included in the personal income series of the Office of Business Economics. Control totals of the aggregate amounts of income, by type of income, and of the total number of families were derived as explained on pages 53 and 78 of the Income Distribution supplement. Families not filing returns were included initially by substituting the number of families with incomes under \$1,000 shown in the inflated sample surveys of the Census Bureau for the corresponding number derived in preceding steps. The total number of nonfarm families in the distribution at this point agreed very closely with the control total number of such families that had been established.

To add the income not accounted for, a comparison was first made between the amounts of each major type of income—wages and salaries, business and partnership income, dividends, interest, rent, etc.—covered in the tax-return-based distribution for nonfarm families and the corresponding control totals for that group developed from the personal income series.

Detailed information was available for earlier years, as described in the Income Distribution supplement, on the distribution by income brackets of certain major elements of income that had to be added (nonmoney income, social security benefits, and other transfer payments.) A distribution by family income brackets of the total amount of income not covered in the tax-return-based nonfarm family distribution was estimated, taking into account this information, the distribution of reported taxable incomes, and the results of the IRS audit studies for 1948 and 1949. The amount of additional income in each income bracket was added to the reported amount, and the families were shifted up the income scale by using the interpolation procedures described on page 61 of the Income Distribution supplement.

The several steps described above were also carried through for the year 1947 in order to determine whether the change in methodology had introduced any basic differences in the income distribution series for nonfarm families. The resulting distribution was found to be closely similar to that presented for 1947 in the Income Distribution supplement. Since the split-income provision for tax returns was not in operation in 1947 and since the sample data used in the

3. The statistical procedures for cross-subtraction (and also for cross-addition mentioned in the following paragraphs) are described in footnote 9, page 36 of the Income Distribution supplement.

Income Distribution supplement for combining earners into families applied to the adjacent year 1946, the 1947 income distribution for nonfarm families in the supplement provided more reliable figures for that year than the procedure described above.

For farm operator families, the income distributions for 1950 and 1951 were derived by essentially the same procedures that are described in the Income Distribution supplement and are subject to the same limitations. The estimates for unattached individuals were obtained by extrapolating the 1947 figures derived in the supplement on the basis of the increase in the average income of the group, on the assumption that relative income differences among these individuals had not changed.⁴ It may be noted that detailed income-tax-based estimates for unattached individuals showed practically no change in relative income distribution during the 1944-47 period.

Before-tax distributions for 1953

Tabulations of Federal individual income tax returns are not yet available for 1953 so that the estimates for that year are of a preliminary character. Sample data on the size distribution of consumer units were available from the Federal Reserve Board's annual Survey of Consumer Finances which indicated that for multiperson families and for unattached individuals, relative differences in incomes were essentially the same in 1953 as in 1951. Accordingly, the income distribution for each group was estimated here by extrapolating the corresponding 1951 distribution on the assumption of unchanged relative income differences.⁴ A similar assumption was made in the case of the farm operator family group, and the distribution for nonfarm families was obtained by subtracting the farm distribution from the all-family estimates. Control totals for 1953 for total family income and the total number of consumer units were obtained for the three consumer groups by the procedures outlined in the Income Distribution supplement.

Federal individual income tax liabilities

Federal individual income tax liability is defined here as the liability reported on individual income tax returns plus an allowance for taxes collected through subsequent audit, minus liabilities of military personnel not living with their families, minus liabilities on net capital gains.

4. The statistical procedures used were similar to those described in footnote 12, page 38, of the Income Distribution supplement.

For 1950 and 1951, Federal individual income tax liabilities of families classified by family personal income brackets represent essentially a rearrangement of the liabilities reported on individual income tax returns as tabulated by the IRS. In broad outline, the procedure for deriving the family liability figures was to shift the reported liabilities (after subtracting estimated liabilities on capital gains) along with the returns as the latter were combined into family units and shifted from adjusted gross income into family personal income brackets by the procedures outlined above. Amounts of tax liabilities on capital gains that were subtracted were estimated on the basis of IRS tabulations showing for each adjusted gross income bracket the amounts of statutory net capital gains segregated for alternative tax, and the amounts taxed at ordinary rates. The tax on the former was derived by multiplying segregated gains by the alternative tax rate and that on the latter by multiplying other gains by the average effective tax rate in each bracket. For unattached individuals, 1950 liabilities were estimated from statutory tax rates as described on pages 74-76 of the Income Distribution supplement, and those for 1951 by extrapolating the 1950 figures by changes in statutory rates for single persons with no dependents.

For 1953, for which comparable information from tax returns was not available, the estimates of liabilities were based on changes in statutory tax rates. Ratios of 1953 to 1951 average tax liabilities for given amounts of net income, based on data supplied by the Treasury Department, were applied to the 1951 liability averages for families and unattached individuals at corresponding points on the family income scale.

The averages for 1950, 1951, and 1953 were then adjusted proportionately so that when multiplied by the numbers of consumer units in the various family income brackets they would account for the estimated total of Federal individual income tax liability (as defined for the purposes of this report) for those years. Although based in part on tax collection data, the estimate of total tax liability for 1953 is preliminary.

Distributions of families and unattached individuals by level of after-tax income were derived for 1950, 1951 and 1953 by subtracting Federal individual income tax liabilities from family personal income in each family income bracket, and shifting the families down the income scale by using the interpolation procedures described on page 61 of the Income Distribution supplement.

The Business Situation

(Continued from page 3)

development of new trade areas. February employment in the transportation and public utilities segment was 2 percent below the 1954 spring quarter average, largely because of the lag in railroad employment. Employment in communications and gas and electric utilities has been better sustained.

The service industry group—consisting of finance, insurance, real estate, service and miscellaneous industries, exclusive here of persons employed in domestic service—like trade is continuing the moderate expansion maintained even during the recent readjustment. Employment growth in this sector reflects population expansion and the steady rise of consumer expenditures for services as well as the growth in the volume of financial activity.

^p Preliminary.

1. Excluding domestic servants.

Source: U. S. Department of Labor, Bureau of Labor Statistics data seasonally adjusted by Board of Governors of the Federal Reserve System except as elsewhere noted.

Employment recovery in the commodity-producing industries has been much smaller. February aggregate employment in these industries, adjusted for seasonal variation, was up about 1 percent from the low point touched in the 1954 summer quarter and was substantially below employment in the spring of 1953. The decline in coal mining employment has been especially pronounced.

Manufacturing employment increase

The recovery of manufacturing activity since last autumn has required an increase in man-hours worked by production employees, in which lengthened hours have played an important part. Since manufacturers had started lengthening

the workweek in the spring of 1954 while employment was still contracting, the recent movement of average hours made the workweek 2 percent longer in February than the average time worked in the comparable month of 1954, whereas employment in February was about 2 percent below that of February 1954.

The reduction of national security expenditures accounts for the curtailment of production worker employment in the ordnance group, for the recent drop in the number of aircraft and parts industry workers, and for part of the lag in employment recovery in such durable goods industries as machinery, which showed its first significant increase in February. High automobile output and sales are reflected not only in the jump in employment in the automotive industry but also in increased employment in the rubber, metal and other related industry groups. The boom in the construction industry is reflected in the better-than-average employment recovery in the lumber and stone-clay-glass industries.

Printing and publishing is the only major manufacturing industry in which current production worker employment stands above 1953 figures, although this favorable employment comparison is coupled with a workweek somewhat shorter than 2 years ago. Employment in the paper and allied products industries is only nominally below 1953 levels.

Workweek longer

The length of the average workweek in manufacturing industries has lengthened by 0.9 hours from early 1954 to early 1955, or by more than half the amount of the contraction that occurred between 1953 and 1954.

The workweek declined somewhat more in the durable goods industries during last year's readjustment than in the non-durable goods industries—approximately paralleling their relative employment experience. In recent months, the most pronounced increase in hours worked has been in industries affected by the surge of automobile production, i. e., primary metals, transportation equipment and rubber products. The workweek in the automobile industry is currently longer than in 1953.

Wage rates continue to rise

The average hourly earnings of productive workers in manufacturing industries moved up one cent an hour in February and stood 3 percent higher than 12 months earlier and 7 percent above February 1953. The recent rate of advance has been slower than the 8-year average rise from 1945 to 1953 of 7 percent annually but it occurred during a period of economic adjustment, and was an important factor in sustaining personal income. Average earnings in durable goods industries of \$1.96 an hour were 6 cents higher than a year earlier while the \$1.68 hourly average in nondurable goods industries was 3 cents higher. In only one major industry group—apparel—was the hourly rate slightly below that of February 1954; in textiles and leather, it was unchanged.

Hourly earnings increases in most nonmanufacturing industries in the past year have been at a somewhat higher average rate than in manufacturing.

Monthly BUSINESS STATISTICS

THE STATISTICS here are a continuation of the data published in BUSINESS STATISTICS, the 1953 Statistical Supplement to the SURVEY OF CURRENT BUSINESS. That volume (price \$1.50) contains monthly data for the years 1949 to 1952, and monthly averages for earlier years back to 1935 insofar as available; it also provides a description of each series and references to sources of monthly figures prior to 1949. Series added or revised since publication of the 1953 Supplement are indicated by an asterisk (*) and a dagger (†), respectively, the accompanying footnote indicating where historical data and a descriptive note may be found. The terms "unadjusted" and "adjusted" used to designate index numbers and dollar values refer to adjustment of monthly figures for seasonal variation.

Statistics originating in Government agencies are not copyrighted and may be reprinted freely. Data from private sources are provided through the courtesy of the compilers, and are subject to their copyrights.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

† Revised.

† Revised series. Quarterly estimates of national income and product have been revised back to 1939 (annual data, to 1929); quarterly and monthly estimates of personal income, back to 1929 (monthly revisions prior to May 1953 appear in the 1954 issue of the National Income Supplement). For quarterly data prior to 2d quarter 1953, see pp. 8 and 9 of the July 1954 SURVEY.

‡ Includes inventory valuation adjustment.

§ Government sales are not deducted.

¶ Personal saving is excess of disposable income over personal consumption expenditures shown as a component of gross national product above.

Revised. † Preliminary.

† Revisions for 1952 for new plant and equipment appear on p. 10 of the March 1954 SURVEY; those for 1953 and estimates for the 1st two quarters of 1955 (based on anticipated capital expenditures of business) appear on p. 8 of this issue of the SURVEY. Revisions for 1952 and 1953 for farm income and marketings are on p. 24 of the January SURVEY; for 1951, on p. 24 of the April 1954 SURVEY.

† Revised series. For a detailed description of the revision and monthly and annual data beginning 1947, see the December 1953 issue of the FEDERAL RESERVE BULLETIN.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

† Revised. ‡ Preliminary. § See note marked "†" on p. S-2.
 *New series. Compiled by the Board of Governors of the Federal Reserve System. For description of the index and back figures, see the May 1954 FEDERAL RESERVE BULLETIN and subsequent issues.
 §The term "business" here includes only manufacturing and trade. Business inventories as shown on p. S-1 cover data for all types of producers, both farm and nonfarm. Unadjusted data for manufacturing are shown on p. S-4; those for retail and wholesale trade, on pp. S-9 and S-10.
 †Revised series. Effective with the December 1953 SURVEY, the data reflect adjustments to more recent benchmarks; all revisions prior to 1953 are available upon request (most of the data published in the 1953 issue of BUSINESS STATISTICS are now obsolete).

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

† Revised. ⊙ Preliminary. ⊙ Data includes some contracts awarded in prior months but not reported.
 † Revisions for new construction (unadjusted) for 1950-1953 appear on p. 24 of the September 1954 Survey. Minor revisions back to 1915 for the Department of Commerce construction cost index are shown in the May 1953 and May 1954 issues of the Construction and Building Materials Statistical Supplement.
 ⊙ Adjusted data not shown in Survey prior to the October 1954 issue. ⊙ Data for April, July, September, and December 1954 are for 5 weeks; other months, 4 weeks.
 ⊙ Data for March, June, August, and December 1954 are for 5 weeks; other months, 4 weeks.
 † Revised series. These data cover nonfarm residential construction authorized in all places (both urban and rural) that require building permits; they replace the former urban-building series which covered new dwelling units authorized in all places defined as urban in the 1940 Census.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey

* Revised. † Preliminary. § Copyrighted data; see last paragraph of headline, p. S-1. ¶ Cost reported at the beginning of each month are shown here for the previous month. †† Revisions for building cost indexes for August–November 1950 and July 1951 and for construction cost indexes for August 1950–November 1952 and May 1953 will be shown later. * New series. Mortgage foreclosures, compiled by the *Housing and Home Finance Agency, Home Loan Bank Board*, represent estimates of the total number of mortgage foreclosures in all nonfarm areas of the U. S. Television advertising cost, compiled by the *Publishers' Information Bureau, Inc.*, covers gross time charges for network advertising on major television networks (ABC, NBC, Columbia, and Du Mont). † Revised series. Data reflect the adoption of a more recent comparison base (except for television) and adjustments of the radio and television components to cover only the network portion of these media. Revisions prior to January 1953 will be shown later. †† Revised to exclude magazine sections of newspapers. Comparable data prior to August 1953 will be shown later.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

† Revised. † Advance estimate. † Revised series. Quarterly estimates have been revised back to 1939; annual data, to 1929. Revisions prior to 2d quarter 1953 for the grand total, total durable and nondurable goods, and services are shown as components of gross national product in table 5 on pp. 8 and 9 of the July 1954 Survey; those for the subgroups appear in the 1954 issue of the National Income Supplement. † Revised series. See corresponding note on p. S-3.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

* Revised. * Preliminary.

Ⓜ Minor changes have been made for May 1950–October 1951. Revisions for November 1951–December 1953 will be shown later.

Ⓜ Data for employment and hours and earnings have been revised effective with the June 1954 SURVEY to adjust to the first quarter 1953 benchmark. Revisions beginning 1951 are available upon request to the Division of Manpower and Employment Statistics, Bureau of Labor Statistics, U. S. Department of Labor, except for the estimates of employment adjusted for seasonal variation which are available from the Board of Governors, Federal Reserve System. Beginning September 1954, the estimates of the number of employees by industry division and the number and index of production workers in manufacturing industries (p. S-12) adjusted for seasonal variation are compiled by the U. S. Department of Labor, Bureau of Labor Statistics. The BLS is currently using the seasonal factors formerly used by the Board of Governors, Federal Reserve System.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955	
	January	February	March	April	May	June	July	August	September	October	November	December	January	February

† Revised. ‡ Preliminary. 1 Includes temporary Post Office employees hired during Christmas season; there were about 304,300 such employees in all areas. 2 Data beginning January 1954 are revised to include additional employees now classified as Federal employees although they are paid from funds appropriated to the District of Columbia. Adjusted data for December 1953, comparable with January 1954: Continental U. S., 2,454,300; Wash., D. C., 212,400.

♂ See corresponding note on p. S-11.

♀ Data beginning January 1953 exclude employees in the General Accounting Office and Government Printing Office who were transferred to the legislative branch; employment in these agencies at the end of January 1953 was as follows: Continental United States—GAO, 6,200; GPO, 7,700; Wash., D. C.—GAO, 4,600; GPO, 7,400. Also, the data beginning January 1953 exclude 1,300 employees of Howard University and Gallaudet College who are not now classified as Federal employees. In addition to the aforementioned exclusions, the January 1953 figure for Continental U. S. reflects a downward revision of approximately 16,000 employees based on more accurate reports from the Post Office Department.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

* Revised. † Preliminary. ? See corresponding note on p. S-11.
 ‡ Revised to include only privately operated lines; data shown in the March 1954 Survey and earlier issues cover both privately operated and government-operated lines.
 § Revised series. Beginning with the February 1954 Survey, data have been revised to exclude transitional claims and, therefore, more closely represent instances of new unemployment.
 * New series. Compiled by the U. S. Department of Labor, Bureau of Employment Security. Data for insured unemployment for continental U. S. (excluding Alaska) have been substituted for the series on number of continued claims filed. The insured unemployment series is derived by adjusting the number of weeks of unemployment for the lag between the week of unemployment and the time the claim is filed, so that the adjusted series refers to the week in which unemployment actually occurred. The monthly figures are averages of weekly data adjusted for split weeks in the month on the basis of a 7-day week. Weekly averages for 1952 appear in the February 1954 Survey.
 ♂ Beginning with the February 1954 Survey, data for veterans' unemployment allowances cover only unemployment compensation benefits under the Veterans Readjustment Assistance Act of 1952. The figures for initial claims exclude transitional claims; the insured unemployment figures exclude claims from veterans which were filed to supplement benefits under State or railroad unemployment-insurance programs to eliminate duplicate counts in the State data shown above; the number of beneficiaries and the amount of payments include all veterans whether or not the payments supplement benefits under either State or railroad insurance programs.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

† Revised. ‡ Preliminary. § Revised data for October-December 1953 (thous. dollars): Total payments to policyholders and beneficiaries—357,360, 349,806, 479,102; policy dividend payments—58,305, 54,493, 126,546.

† Revisions to be shown later are as follows: Insurance written (total, industrial, and ordinary) for 1953; premium income for 1951 and 1952; silver production for 1953.

‡ Data for 1954 for total ordinary insurance written include revisions not distributed by regions.

§ Or increase in earmarked gold (-).

† Revised series, reflecting change in number of reporting banks and centers. Data for 1943-53 for New York City appear on p. 23 of the September 1954 SURVEY; those for other centers will be shown later.

‡ Includes Boston, Philadelphia, Chicago, Detroit, San Francisco, and Los Angeles.

* New series. Compiled jointly by the Federal Trade and Securities and Exchange Commissions. Data are estimated totals based on reports from all manufacturing corporations registered with SEC, all nonregistered manufacturing corporations with total assets of \$5,000,000 and over at the end of 1949, and a sample of nonregistered manufacturing corporations with total assets of less than \$5,000,000 at the end of 1949. Comparable data for 1951-53 appear on p. 27 of the December 1954 issue of the SURVEY.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

* Revised. † Preliminary.

‡ Revisions for 1946-53 for balance of payments appear on pp. 16 and 17 of the July 1954 SURVEY; those prior to August 1953 for foreign trade will be shown later.

♂ Excludes military expenditures. § Excludes "special category" shipments and all commodities exported under foreign-aid programs as Department of Defense controlled cargo.

¶ Total exports and data by economic classes and commodities include shipments under the Mutual Security Program. Total MSP shipments are as follows (mil. dol.): January 1954-December 1954 respectively—169.3; 184.4; 203.4; 167.2; 264.2; 359.3; 267.6; 200.4; 156.8; 103.7; 85.1; 100.1.

Δ Excludes shipments under MSP and "special category" shipments not made under this program.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

* Revised. p Preliminary.
 †Data have been revised (beginning August 1945) to include fares charged by transit companies operating in cities having a 1950 population of 25,000 or over; revisions prior to August 1952 will be shown later.
 §Data have been revised to cover intercity carriers of all types of commodities, including common carriers of general and special commodities and contract carriers. It should be noted that the data for 1945-53 shown in BUSINESS STATISTICS (1953 edition) and in the October 1953-December 1954 issues of the SURVEY are for carriers of general commodities only. Revised data for 1945-52 will be shown later. Revisions for the first three quarters of 1953 are shown in the January 1955 SURVEY.
 ♂Data for January, May, July, October 1954 and January 1955 are for 5 weeks; other months, 4 weeks.
 ○Data beginning January 1954 include vessels under time and voyage charter to Military Sea Transportation Service; revised monthly data for 1953 to include these clearances will be shown later. †Revised data for December 1953, \$79,989,000.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

† Revised. ‡ Preliminary. § Not available for publication. ¶ Beginning January 1955, data relate to high-gravity and yellow-distilled glycerin are combined with chemically pure glycerin. * New series. Compiled by the U. S. Department of Justice, Immigration and Naturalization Service. Data relate to the arrivals and departures of aliens, by sea and by air, between ports of the United States and noncontiguous foreign territory. These statistics do not include border crossers, seamen, military personnel, traffic between continental United States and insular possessions, and cruise travelers. Data prior to 1953 will be shown later. (Old series covered emigrant and immigrant aliens only.)
 ¶ Data beginning January 1954 cover 38 companies (those having an annual gross operating revenue of \$1,000,000 or more). However, the smaller number of companies continues to account for 90 percent of the annual gross operating revenues of the industry. † Revisions for 1952 (also 195

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1954

† Revised. ‡ Preliminary. § December 1 estimate of 1954 crop. ¶ Beginning January 1955 excludes quantities held by consuming factories. Comparable data for December 1954 (units as above): Margarine, 26,960; shortening, 119,597.

¶ Revisions for 1952 for linseed oil and soybean oil and for September 1951-September 1952 for margarine will be shown later.

§ Revisions for 1952 appear in the September 1953 SURVEY; those for 1951 will be shown later.

¶ Revisions for 1952 for electric-power production are shown in the October 1953 SURVEY; those for electric-power sales and revenues, in the October and November 1953 issues.

Table header for the survey, showing months from January 1954 to February 1955. Includes the note: 'Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey'.

ELECTRIC POWER AND GAS—Continued

Table containing data for 'ELECTRIC POWER AND GAS—Continued'. Categories include 'GAS' and 'Natural gas (quarterly):'. Rows list metrics like 'Manufactured and mixed gas (quarterly):', 'Customers, end of quarter, total', and 'Revenue from sales to consumers, total' across the 14 months from January 1954 to February 1955.

FOODSTUFFS AND TOBACCO

Table containing data for 'FOODSTUFFS AND TOBACCO'. Sub-sections include 'ALCOHOLIC BEVERAGES' (Fermented malt liquors, Distilled spirits, Whisky, Rectified spirits, Wines), 'DAIRY PRODUCTS' (Butter, Creamery, Cheese, Condensed and evaporated milk, Fluid milk, Dry milk), and 'Tobacco' (Production, Stocks, Exports, Imports). Rows list various production and stock metrics across the 14 months from January 1954 to February 1955.

* Revised. † Revisions for 1952 appear in the October 1953 SURVEY; those for the 1st and 2d quarters of 1953 are available upon request. ‡ Data beginning July 1953 exclude production of wines and vermouth; for July 1952-June 1953 such production totaled 88,000 gallons. § Revisions for July 1952-March 1953 for rectified spirits, etc., and wines and distilling materials appear in the June 1954 SURVEY; those prior to 1954 for other indicated items will be shown later.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

* Revised. † Preliminary. ‡ December 1 estimate of 1954 crop.
 § Old crop only; new grain not reported until beginning of new crop year (July for barley, oats, and wheat; October for corn).
 ¶ Bags of 100 lb.; prior to the October 1953 SURVEY, data were shown in thous. of bu. of 45 lb.
 Ⓞ The total includes wheat owned by the Commodity Credit Corporation and stored off farms in its own steel and wooden bins; such data are not included in the breakdown of stocks.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

† Revised. ‡ Preliminary.

‡ Revised from 1950 forward to reflect adjustments to 1953 benchmark materials; 1950-52 annual totals and monthly data for January-September 1953 will be shown later.

⊕ Revised monthly data (for production, shipments, and stocks; also orders, except for all types of lumber) are available upon request as follows: Total, all types, January 1950-February 1953; Douglas fir, January 1952-February 1953; Southern pine, January-December 1951; Western pine, January 1950-February 1953.

⋮ Revisions for 1952 for exports of Douglas fir sawmill products will be shown later.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

* Revised. † Preliminary.

*New series. Data for hardwood plywood are compiled by the U. S. Department of Commerce, Bureau of the Census; they cover all known market producers of hardwood types, except as indicated.

o Douglas fir plywood production is compiled by the Douglas Fir Plywood Association. Data presented are total industry figures, based on reports from plants controlling, on the average, approximately 90 percent of industry capacity. The monthly totals are estimated from weekly reports by prorating split weeks on the basis of a 5-day workweek, with allowance for generally observed holidays.

† Data for production and receipts of iron and steel scrap are compiled by the U. S. Department of Interior, Bureau of Mines; data prior to 1953 are not available for publication.

o In the 1952 edition of the export schedule, certain items (pipe fittings, welding rods, bolts, fabricated structural and other shapes) were transferred from the steel-mill products to the metal manufactures category. The data through 1952 as shown in the 1953 edition of BUSINESS STATISTICS were adjusted to include exports of these commodities for comparability with the earlier data. Exports beginning January 1953 as published in the March 1953 SURVEY and subsequent issues exclude these items which averaged 21,300 short tons per month in 1953.

o Revisions for 1952 are shown in the April 1954 SURVEY.

† For 1955, percent of capacity is calculated on annual capacity as of January 1, 1955, of 125,828,310 tons of steel; for 1954, data are based on capacity as of January 1, 1954 (124,330,410 tons);

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey. Table header for months: January, February, March, April, May, June, July, August, September, October, November, December, 1955 (January, February).

METALS AND MANUFACTURES—Continued

Main data table with columns for months and rows for various metal and manufacturing categories including Iron and Steel, Nonferrous Metals, Aluminum, Copper, Tin, and Zinc.

* Revised. * Preliminary. † Specifications changed; not comparable with data prior to June 1954. ‡ Production by secondary plants only. § Data beginning January 1954 are based on a more comprehensive survey. ¶ Comparable figures for December 1953 (mil. lb.): Total wrought products, 150.7; plate and sheet, 90.9. § Revisions for 1952 imports are shown in the April 1954 SURVEY. ¶ Substituted series. Compiled by the U. S. Department of Interior, Bureau of Mines; monthly data for 1951 and 1952 appear on p. 24 of the March 1954 SURVEY. Government stocks represent those available for industrial use.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

† Revised. ‡ Preliminary § Represents 5 weeks' production. ¶ Data beginning July 1954 are for 13 companies; earlier data, 11 companies.

‡ Revisions for oil burners for January-July 1952 are shown in a footnote on p. S-33 of the January 1954 SURVEY; revised data for other items of heating apparatus will be shown later.

§ Data beginning June 1953 are compiled by *The Institute of Boiler and Radiator Manufacturers* and represent substantially complete coverage of shipments of cast iron radiators and convectors.

* New series. For source of data and brief description, see corresponding note on p. S-34 of September 1954 SURVEY.

† Revised to reflect use of new base period. Comparable data for 1934-53 for all series (except for foundry equipment) appear on p. 28 of the February 1955 SURVEY.

‡ Includes contractors' off-highway wheel-type tractors.

§ Radio production comprises home, portable battery, automobile, and clock models; television sets include combination models. Data for March, June, September and December 1954 cover 5 weeks; other months, 4 weeks.

¶ Data beginning January 1954 cover 19 companies.

‡ Data for polyphase induction motors cover 33 companies; for direct current motors and generators, data for 1st quarter 1954 cover 26 companies, thereafter, 27.

§ Revised to represent weighted average price of anthracite stove based on quotations in 6 cities as follows: Baltimore, Boston, Laconia (N. H.), Madison (Wis.), Middletown (Conn.), and New York.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

* Revised. † Preliminary. ‡ Data cover a 5-week period. § See note marked "§" for change in sample coverage beginning January 1954. ¶ Revisions for 1952 are shown in the August 1953 SURVEY. Ⓜ Includes laminated board (reported as component board) also sheathing and formboard.

*New series. Compiled by the U. S. Department of Commerce, Bureau of the Census. Data are estimated industry totals derived as follows: Men's apparel—estimates beginning 1954 are based on a monthly sample survey of manufacturers, accounting for approximately 75 percent of total production; data prior to 1954 are based on a sample covering establishments that accounted for about 90 percent of the total 1950 cuttings of these items. Women's outerwear—based on reports from establishments classified in the women's principal outerwear industries for the specified items; monthly data beginning January 1954 are estimated from reports of producers that account for approximately 75 percent of total output; quarterly estimates prior to 1954 are based on reports from 2,500 establishments accounting for about 90 percent of total shipments in 1951. Data prior to 1952 for all series and for January–December 1952 and January 1954 for men's dungarees and waistband overalls will be shown later; data for 1952 (except men's dungarees, etc.) are shown at bottom of p. S-38 of the December 1953 SURVEY.

† Data for March, June, September, and December 1954 cover 5-week periods and for other months, 4 weeks.

‡ Includes cumulative revisions for 1954 through May. § Includes cumulative revisions for June–August 1954.

Unless otherwise stated, statistics through 1952 and descriptive notes are shown in the 1953 Statistical Supplement to the Survey	1954												1955

† Revised. ¶ Preliminary. 1 Coaches included with trucks.

‡ Revisions for 1952 are shown in the August 1953 SURVEY.

♀ Data exclude all military-type exports. Scattered monthly revisions for 1952 for motor vehicles will be shown later.

♂ Revised beginning 1952 to include production of converter dollies; data as revised are comparable with figures through 1951 shown in the 1953 issue of BUSINESS STATISTICS. Revisions for January-September 1952 are shown in the December 1953 SURVEY.

⊕ Excludes railroad shops except when noted.

* New series; monthly data prior to 1953 will be shown later.

§ Not including railroad-owned private refrigerator cars.

¶ Revised exports for May 1952, 41 locomotives.

INDEX TO MONTHLY BUSINESS STATISTICS, Pages 81-840

INCOME DISTRIBUTION

in the United States

... by size of income

**a valuable tool for market analysis
and development,
focusing on a major determinant
of consumer demand**

Fresh information on the distribution of the Nation's purchasing power according to the size of family income is revealed for the first time in this volume, the result of years of pioneer research by the Office of Business Economics. Integrated with OBE's authoritative national income series, complete with explanations and source material, the unique INCOME DISTRIBUTION supplement to the Survey of Current Business lays the foundation for a new series on income changes hereafter to be published regularly.

orders may be placed with the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C., or the nearest Department of Commerce Field Office. 86 pages. 65 cents per copy.
