the BUSINESS SITUATION

REAL GNP declined 2½ percent at an annual rate in the fourth quarter of 1982, the net result of sharp changes in most components (table 1 and chart 1).¹ These changes reflected the wide spectrum of forces affecting economic activity—lower and, in some cases, decelerating rates of price increase; sharply lower interest rates; appreciation of the dollar; and depressed levels of economic activity here and abroad. Personal consumption expenditures (PCE) was up sharply. Increases were widespread; in durables, where lower interest rates were a factor, the increase was quite strong. Nonresidential fixed investment declined further, in part due to poor profits and low rates of capacity utilization. Lower interest rates appear to have turned residential investment around. Imports declined, but exports declined even more, and net exports dropped, as they continued to show the effects of the dollar's appreciation and the worldwide recession. An increase in government purchases was largely due to operations of the Commodity Credit Corporation

(CCC). CCC purchases stepped up as farmers responded to sharply lower prices for crops by putting substantial amounts under loan. Business inventories registered a large swing, from modest accumulation in the third quarter to substantial decumulation in the fourth.

As shown in table 2, the business inventory swing amounted to \$21 billion (1972 dollars); final sales were up \$11½ billion, or 3 percent; and GNP was down \$9½ billion.² Table 2 also breaks out motor vehicles. With vehicle output down \$7½ billion and final sales up \$6½ billion, the inventory swing—from accumulation in the third quarter to liquidation in the fourth—was \$14 billion.

Prices.—GNP prices as measured by the fixed-weighted price index increased 5 percent at an annual rate (table 3). Quarterly increases in 1982 have ranged from 4 to 6 percent, down substantially from increases in 1981 of 8½ to 10 percent. A Federal pay raise, which is reflected in the prices of employee services purchased by the Federal Government, accounted for 0.4 percentage points of the fourth-quarter increase.

Prices of PCE were up 5½ percent at an annual rate, after an increase of 7½ percent in the third quarter. Larger increases in the second half of the year—prices had increased 5 and 3 percent, respectively, in the first and second quarters—were due to energy prices. Gasoline prices had declined in the first and second quarters, but then increased, substantially in the third quarter and moderately in the fourth. Natural gas prices continued to increase in the range of 20-

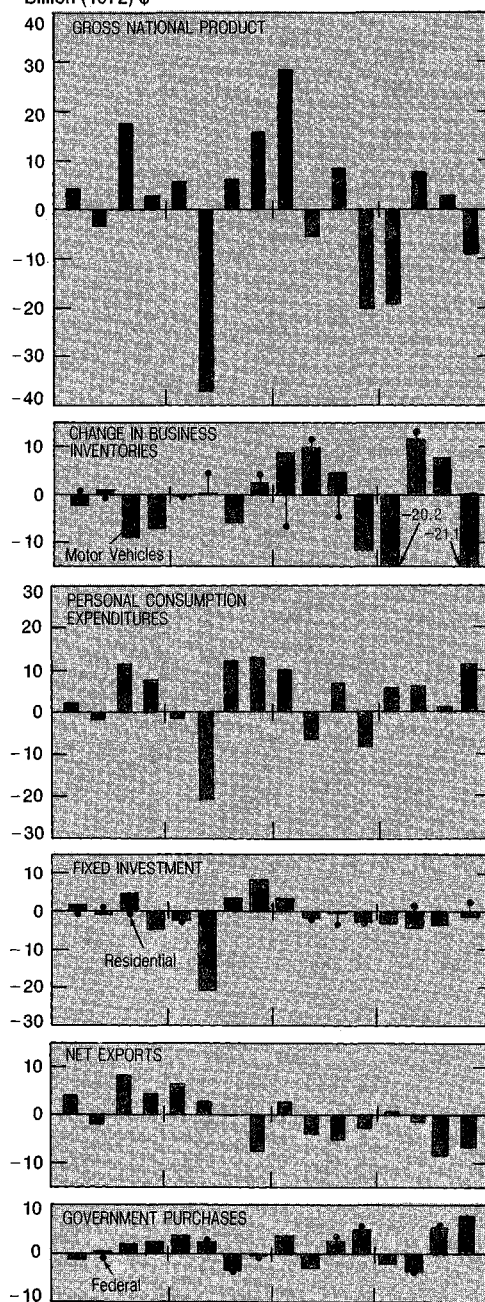

1. The fourth-quarter GNP estimates are based on the following major source data: For *personal consumption expenditures* (PCE), retail sales, and unit auto and truck sales through December; for *nonresidential fixed investment*, the same information for autos and trucks as for PCE, manufacturers' shipments of machinery and equipment for October and November, October and November construction put in place, and investment plans for the quarter; for *residential investment*, October and November construction put in place, and housing starts for October and November; for *change in business inventories*, October and November book values for manufacturing and trade, and unit auto and truck inventories through December; for *net exports of goods and services*, October and November merchandise trade, and fragmentary information on investment income for the quarter; for *government purchases of goods and services*, Federal unified budget outlays for October and November, State and local construction put in place for October and November, and State and local employment through December; and for *GNP prices*, the Consumer Price Index for October and November, and the Producer Price Index for October and November. Some of these source data are subject to revision.

2. Quarterly estimates of the national income and product accounts are expressed at seasonally adjusted annual rates, and quarterly changes in them are differences between these rates.

CHART 1

Real Product: Change From Preceding Quarter

Billion (1972) \$

Based on Seasonally Adjusted Annual Rates

35 percent, partly due to the effect of the phased deregulation. Food prices continued to decelerate. They increased only about ½ percent in the fourth quarter, down from 7 percent in the first. Prices of other PCE increased 6½ percent; earlier in the year, increases had ranged from 6 to 7½ percent.

Prices of fixed investment goods increased only moderately in the fourth quarter—about 2½ percent at an annual rate for nonresidential and ½ percent for residential. For nonresidential investment, this rate was several percentage points less than earlier in the year. For residential investment, prices had moved erratically earlier, including a one-quarter decline. Prices of goods and services purchased by government increased 7 percent; excluding the effect of the Federal pay raise, the increase was 4½ percent. Earlier increases had ranged from 4 to 6 percent.

Costs and productivity.—The slower rate of inflation in 1982 in the prices of final goods and services has been accompanied by a slowing of the increase in compensation per hour. In the business economy other than farm and housing, the fourth-quarter increase was 5 percent at an annual rate (table 4). In late 1981 and early 1982, increases had been about 7½ percent, and in the second and third quarters, about 6½–7 percent.

Table 4 also shows the increase in productivity as measured by real gross product per hour. Productivity increased in the fourth quarter, as it had in each quarter this year. The fourth-quarter increase of 1 percent at an annual rate reflected a larger drop in aggregate hours than in real product—5 percent for hours and 4 percent for product. (Real product in this sector was down more than GNP mainly because farm product, which is in GNP but not in this sector, increased very sharply.)

Despite the decline in product, the increase in unit labor cost was relatively small—3½ percent at an annual rate—because compensation was down. Declines in compensation have been infrequent in the last 20 years; earlier in the postwar period it was not uncommon for compensation to decline in at least one quarter of a recession. Although the fourth-quarter

1. Index number levels for the third quarter of 1981 through the fourth quarter of 1982 were: 217.6, 222.5, 225.2, 227.0, 229.2, and 231.8.

2. Inasmuch as GNP is the sum of final products, the food and energy estimates in this table do not take into account the effect on the prices of final products of changes in the prices of the food and energy that are costs of production.

3. Consists of all components for which separate estimates are prepared. The major component that is not included is purchases of food by the Federal Government other than transactions by the Commodity Credit Corporation that are treated like purchases.

4. Consists of all components for which separate estimates are prepared. The major components that are not included are (1) exports of energy; (2) the gasoline and motor oil portions of inventories of gasoline service stations, and (3) the energy portions of inventories of businesses that do not produce energy for sale.

5. The Federal pay raise accounted for 1.2 percentage points of the increase in the index for GNP in the fourth quarter of 1981 and 0.4 percentage points in the fourth quarter of 1982.

Note.—Index number levels are found in the National Income and Products Accounts Tables, table 7.2.

Table 4.—Real Gross Product, Hours, and Compensation in the Business Economy Other Than Farm and Housing: Change From Preceding Quarter

[Percent change at annual rates; based on seasonally adjusted estimates]

Compensation per hour.....	7.3	17.8	6.7	6.9	5.0	
Unit labor cost.....	11.9	7.9	5.3	3.0	3.7	

1. Increases in employers' contributions for social security in the first quarter of 1982 accounted for 0.6 percentage points of the increase in compensation per hour.

increase in unit labor cost was up somewhat from the 3 percent registered in the third quarter, increases have been progressively smaller since last year.

Labor market conditions.—Major indicators of labor market conditions worsened in the fourth quarter. Employment as measured by both the household and establishment series declined, the former by 470,000 (seasonally adjusted) and the latter, a

measure of nonfarm payroll employment, by 680,000. About two-thirds of the decline in the establishment series was in durable goods manufacturing, particularly in primary and fabricated metal products and in non-electrical machinery. The unemployment rate jumped 0.7 percentage points to a postwar high of 10.7 percent.³ The rate for adult men, who have been particularly hard hit by the recession, jumped 0.9 points, to 10.0 percent. The number of unemployed reached 11.8 million, up 0.8 million from the third quarter; another 1.8 million persons, up 0.2 million, reported they wanted a job but did not look for one because they did not believe they could find one. Average weekly hours in the private nonfarm economy slipped further, from 34.8 in the third quarter to 34.7 in the fourth.

3. These unemployment rates incorporate the annual revision of the household survey series. Thus, they differ from the unemployment rates presented in the "Business Situation" in the December 1982 SURVEY OF CURRENT BUSINESS.

Personal income and its disposition

The increase in personal income decelerated to \$30½ billion from \$40 billion in the third quarter (table 5). Wage and salary disbursements slowed sharply to a small increase, personal interest income declined, proprietors' income was up strongly, and transfer payments registered another large increase.

Wage and salary disbursements increased only \$2½ billion in the fourth quarter, following a \$13½ billion increase in the third. Private wages and salaries registered the first decline since the first quarter of 1975: Employment and hours were both down, and the increase in hourly earnings slowed. In the commodity-producing industries, durables manufacturing wages and salaries were down substantially more than in the third quarter; in the distributive industries, trade declined following an increase, and transportation declined more than in the third quarter; and in the

service industries, increases were smaller. Wages and salaries paid by government and government enterprises were up more than in the third quarter; the 4 percent pay raise for most Federal employees, which totaled \$2½ billion, accounted for the difference.

The decline in personal interest income was the first in the postwar period and followed a sharp slowdown in the third quarter. The swing from an increase of \$12½ billion in the second quarter to a \$1 billion decline in the fourth quarter was concentrated in interest from money market fund shares and large-denomination time deposits, and reflected a steep slide in short-term interest rates (chart 2). (The growing importance of these assets in recent years is described in the article "The Monetary Aggregates: An Introduction to Definitional Issues" later in the SURVEY OF CURRENT BUSINESS.) The rate on large-denomination, negotiable 6-month certificates of deposit fell from 14 percent in the middle of the second quarter to 11½ percent in the middle of the third and to 9 percent in the middle of the fourth.

Farm proprietors' income increased \$6 billion, after declining \$½ billion in the third quarter. The increase was more than accounted for by an \$8 billion step-up in subsidy payments by the CCC. Roughly one-quarter of the step-up was in regularly scheduled deficiency payments for 1982 crops—mainly wheat and cotton. (Deficiency payments are made when the market price of a covered crop falls below a "target price.") Most of the remainder was due to a speed-up in payments for 1982 crops—mainly corn and other feed grains—that would otherwise have been paid in the first quarter of 1983 and to diversion payments for some 1983 crops. (Diversion payments are made to farmers who set aside crop acreage from production.) Other farm income continued to slide: Receipts for marketings were down in the fourth quarter, as prices tumbled and more than offset an increase in the volume of production. The increase in nonfarm proprietors' income can be attributed partly to pickups in the construction, real estate, and securities industries.

Transfer payments increased about as much in the fourth quarter as in

Selected Interest Rates

83-1-2

the third—\$16 billion. In the third quarter, they had been boosted \$12 billion by cost-of-living increases in benefits paid under several Federal programs, primarily social security. In the fourth quarter, the increase in social security payments was usually large, partly reflecting retroactive payments and resumption of payments to college students. Unemployment insurance benefits, which had increased \$2 billion in the third quarter, were up \$6½ billion in the fourth. The pickup was due to supplementary extended benefits authorized under the Tax Equity and Fiscal Responsibility Act of 1982.

Personal income was reduced \$1½ billion as a result of property damage done by hurricane Ewa in Hawaii and by extensive flooding in the Mississippi River basin. This damage is reflected in the proprietors' and rental income components. Setting aside the effects of these disasters and the other special factors listed as addenda to the table, the fourth-quarter deceleration in personal income is narrowed only slightly.

Personal tax and nontax payments increased \$5½ billion after a \$6½ billion decline. In the third quarter, legislative changes, mainly the withheld income tax rate reductions under the Economic Recovery Tax Act of 1981 (ERTA), on balance, had reduced taxes \$18½ billion. In the fourth quarter, legislative reductions under ERTA amounted to \$3 billion, including a \$1½ billion reduction in estate and gift taxes. (Increases in personal taxes under the Tax Equity and Fiscal Responsibility Act of 1982 do not become effective until 1983.) Reflecting the weakness in personal income, the increase in taxes due to increases in the tax base decelerated to \$8½ billion from \$11½ billion.

Disposable personal income increased a little more than one-half as much as in the third quarter. In real terms it changed little, following a 1½-percent increase in the third quarter and a 3-percent increase in the second. The slowing in disposable income, coupled with a step-up in the increase in personal outlays, resulted in a sharp drop in personal saving.

The personal saving rate fell to 5.8 percent—the lowest rate in nearly 2 years—from 6.9 percent in the third quarter.

Real PCE.—Developments in real disposable income in combination with other general factors that influence PCE do not yield a clear answer to why PCE increased as strongly as it did in the fourth quarter—5 percent at an annual rate—after several quarters of lackluster performance. Some of these factors showed improvement, others did not. Interest rates have come down from the high levels that acted as a deterrent to the incurrence of debt and as an incentive to save, and consumer balance sheets, as indicated by real net worth, appear to have improved again in the fourth quarter. On the other hand, labor market indicators that proxy concern about job security worsened.

The size and composition of the increase in PCE on durables points to the significant role of interest rates in boosting consumer purchases—both directly, via the rate on auto installment and other consumer loans, and indirectly, via the effect of lower mortgage rates in spurring housing sales, which in turn led to increased sales of household furniture and equipment. Sales of motor vehicles, both autos and trucks, were up substantially. Major automakers, through their financial subsidiaries, subsidized auto installment loan rates. These rates—less than 11 percent—applied, for the most part, to 1982 models. In November, when these rates were introduced, domestic unit sales (about two-thirds of which are sales to consumers) climbed to 6.8 million at an annual rate, the highest rate since August 1981. In December, as stocks of 1982 models dwindled, sales fell back to 6.1 million, but remained above the third-quarter rate. PCE on household furniture and equipment was up 3½ percent. These expenditures had been on a downtrend since the first quarter of 1981, interrupted only in the second quarter of this year.

With one exception, all other categories of PCE goods and services performed better than in the third quarter. The exception was fuel oil, which was down slightly because of the unseasonably warm weather. “Other” durables and gasoline declined less than in the third quarter, and cloth-

ing and shoes increased after no change. Other categories increased more than in the third quarter; among these, a sharp increase in “other” services was largely accounted for by commissions paid to brokers.

Real investment

Nonresidential fixed investment deteriorated in the fourth quarter. The structures component declined slightly, as it had in the third quarter, and producers’ durable equipment (PDE) declined sharply, as it had earlier in the year. In structures, off only 2½ percent at an annual rate, declines in several components more than offset increases in several others. Declines continued in commercial buildings other than offices and in petroleum and natural gas well drilling, and public utilities declined after earlier increases. Office building continued to increase, although less than in the first half of the year, and industrial building increased after earlier weakness.

In PDE, which declined 12 percent at an annual rate, motor vehicles declined following an increase. The disparate movements of motor vehicles in PDE and in PCE partly reflected the fact that subsidized interest rates did not apply to fleet purchases by business. Almost all types of nonvehicle PDE continued to decline. In fabricated metals equipment, metalworking machinery, general industrial machinery, communications equipment, and instruments the declines were especially large.

The persistence of high interest rates on long-term corporate debt well into 1982, low capacity utilization, and the poor performance of corporate profits were major factors in the 8½-percent decline of nonresidential investment from the fourth quarter of 1981. Only the unfavorable impact of interest rates has abated. Capacity utilization declined throughout 1982; in manufacturing, only about two-thirds of capacity was in use in the fourth quarter. Domestic profits of nonfinancial corporations remain depressed despite a third-quarter increase, which was concentrated in profits of petroleum manufacturing. A continuing impact of these factors is consistent with the results of the BEA survey of year-ahead plans for plant

and equipment expenditures, which are presented later in this issue. In current dollars, plans show a decline in capital expenditures for 1983—the first year-to-year decline in 20 years in the plant and equipment surveys taken at the turn of year. When adjusted by BEA for price changes, the expenditures show a 5.2-percent decline.

Residential investment turned around, increasing 23½ percent at an annual rate. Construction of single-family houses and the component of residential investment that includes brokers’ commissions on the sale of residences both strengthened. Mortgage interest rates have declined as part of the general decline in interest rates, although, as seen in chart 2, less rapidly than short-term rates. The effect of the interest rate decline and other financial developments on residential investment was discussed in the “Business Situation” in the December 1982 SURVEY. Construction of multifamily housing, which had increased in the third quarter under the impetus of Federal commitments to purchase below-market-rate mortgages under the Section 8 rental assistance program, was flat in the fourth quarter.

Business inventories were run off at an annual rate of \$17½ billion in the fourth quarter, following a \$3½ billion accumulation in the third; thus, the swing amounted to -\$21 billion. A major portion of the swing was in motor vehicle inventories; they declined \$7½ billion, as stocks of 1982 model cars and trucks were liquidated, following a \$6½ billion buildup in the third quarter.

The liquidation of business inventories since the fourth quarter of 1981 has totaled \$8½ billion, or 2½ percent—more than in any of the last four recessions. Most of the liquidation was in manufacturers’ inventories, and was spread across all major durable and nondurable categories. Declines in primary and fabricated metals and in electrical and nonelectrical machinery were especially sharp. Trade inventories were down only slightly; declines centered in retail auto dealers and in nonmerchandise wholesalers.

An overview of inventory developments may be obtained by relating inventories to total business final sales. Analytical use of this ratio implies

CHART 3

Constant-Dollar Business Inventory-Final Sales Ratios

Note.—"Total" is total business inventories divided by total business final sales, and "goods and structures" is nonfarm business inventories divided by business final sales of goods and structures.

U.S. Department of Commerce, Bureau of Economic Analysis

83-1-3

that the production of services results in a demand for inventories that is similar to that generated by the production of goods and structures. The ratio changed little in 1982, before declining in the fourth quarter (chart 3). Throughout the current recession it has remained well below the levels reached in the 1970 and 1973-75 recessions. A characteristic of the ratio that would have brought it down, other things being equal, is the reflection in its denominator of the rapid increase in services during the latter part of the 1970's and their continued increase during the last 3 years' economic weakness. The low level of the ratio in historical perspective indicates that inventories in the aggregate were well-balanced relative to sales at the end of 1982 and suggests that a recovery in sales would need to be accompanied by a quick rebuilding of inventories.

An alternative ratio is that of nonfarm inventories to final sales of goods and structures. Use of this ratio implies that the production of services does not generate demand for inventories. This ratio moved up through the third quarter of 1982, when it was higher than at any time except during the 1973-75 recession. In the fourth quarter, it declined sharply. It is less clear from the level of this ratio in the fourth quarter that inventories in the aggregate were back in line with sales.

Real net exports

Net exports were down \$6½ billion in the fourth quarter to \$21 billion, as exports dropped more than imports (chart 4). After a peak of \$53½ billion in mid-1980, net exports have declined in all but two quarters. The decline in the fourth quarter of this year and that in the third, which was \$8½ billion, were especially large; in those quarters, a decline in the balance on investment income, which had held up relatively well, occurred along

with a continuing deterioration in the trade balance.

In exports, merchandise trade and investment income contributed about equally to the \$11 billion fourth-quarter decline. Economic activity abroad remained depressed, and the dollar has appreciated substantially against the currencies of major industrial nations (chart 5). These developments in combination with declining U.S. interest rates, which influenced investment income, were major factors affecting exports. In merchandise trade, declines were widespread among end-use categories, but about one-half was in autos to Canada and other capital goods.

In imports, also, both merchandise trade and investment income contributed to the fourth-quarter decline, which amounted to \$4½ billion. Merchandise trade accounted for somewhat more than one-half, as most end-use categories declined. The decline in autos from Canada was especially sharp. Petroleum imports were down; volume declined from 5.77 million barrels a day (seasonally adjusted) in the third quarter to 5.65 billion in the fourth. In investment income, the decline was largely traceable to the fall in Eurodollar rates.

Government purchases

Real government purchases increased 28½ percent at an annual rate in the fourth quarter, following an in-

crease of 23 percent in the third. In both quarters, the major factor in the large increase was purchases by the CCC. These purchases stepped up from \$3 billion in the third quarter to \$10 billion in the fourth, as farmers responded to low market prices for crops by putting larger amounts, especially of corn and soybeans, under loan. (The treatment of the CCC in the national income and product accounts and the problems of using changes in CCC purchases to explain changes in GNP were discussed in a Special Note in the January 1982 SURVEY.)

National defense purchases increased, but less than in the two preceding quarters. As discussed in the Special Note on defense purchases in the November 1982 SURVEY, throughout the 1979-82 period, over which defense purchases have been on an up-trend, the pattern of quarterly changes was often irregular. The increases in the second and third quarters centered in services, such as depot maintenance, and in military hardware. The third-quarter increase included a speed-up in deliveries of aircraft, such as the F-16. In the fourth quarter, hardware deliveries increased less, as did a wide range of other purchases. The slowing of purchases other than for hardware probably reflected concern about appropriations for fiscal 1983.

Nondefense purchases other than CCC continued the decline begun in the fourth quarter of 1981. In State and local government purchases, a slight increase was in structures; other components showed little change.

The Federal sector.—Changes in current-dollar Federal receipts and expenditures on a national income and product accounts basis are shown in table 6. In expenditures, the purchases just described amounted, in current dollars, to an increase of \$17 billion, and the increase in transfer payments described in connection with personal income amounted to \$16½ billion. The subsidy payments to farmers referred to in connection with proprietors' income boosted subsidies less the current surplus of government enterprises, and that item increased \$11 billion. Among the expenditure components, only net interest paid was down.

CHART 5
Factors Affecting Net Exports

2. Trade-weighted average index of foreign currency price of the U.S. dollar.
Data: Federal Reserve Board, OECD, Statistics Canada, and Ministry of International Trade and Industry (Japan).
U.S. Department of Commerce, Bureau of Economic Analysis 83-1-5

Although the estimate of total receipts cannot be completed until estimates of corporate profits, and thus of corporate profits tax accruals, are available, it is quite likely that receipts were up only moderately in the fourth quarter. Personal taxes increased \$3½ billion; indirect business taxes and contributions for social insurance showed no change, reflecting weakness in the tax base.

With expenditures up \$46 billion and receipts up only moderately, the deficit on a national income and product accounts basis increased substantially and approached \$200 billion.

Table 5.10-5.11:

1. Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from current-dollar inventories in this table is not the current-dollar change in business inventories (CBI) component of GNP. The former is the difference between two inventory stocks, each valued at their respective end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarter rates, whereas CBI is stated at annual rates. Quarter-to-quarter changes calculated from the constant-dollar inventories shown in this table are at quarter rates, whereas the constant-dollar change in business inventories component of GNP is stated at annual rates.

2. Quarterly totals at monthly rates. Business final sales equals final sales less gross product of households and institutions, government, and rest-of-the-world and includes a small amount of final sales by farms.

Table 5.8-5.9:

1. The IVA shown in this table differs from that which adjusts business income. The IVA in this table reflects the mix of methods (first-in-first-out, last-in-first-out, etc.) underlying book value inventories derived primarily from Census Bureau Statistics. The mix differs from that underlying business income derived primarily from Internal Revenue Service statistics.

Table 8.1.—Percent Change From Preceding Period in Gross National Product in Current and Constant Dollars, Implicit Price Deflator, and Price Indexes

Table with multiple columns: Percent (1981, 1982 P), Percent at annual rates (Seasonally adjusted: 1981, 1982). Rows include categories like Gross national product, Personal consumption expenditures, Durable goods, Nondurable goods, Services, Gross private domestic investment, Fixed investment, Nonresidential, Residential, Exports, Imports, Government purchases of goods and services, Federal, National defense, Nondefense, State and local, Addenda, Gross domestic purchases, Final sales, Final sales to domestic purchasers, Gross domestic product, Business, Nonfarm, Disposable personal income.

NOTE.—The implicit price deflator for GNP is a weighted average of the detailed price indexes used in the deflation of GNP. In each period, the weights are based on the composition of constant-dollar output in that period. In other words, the price index for each item (1972=100) is weighted by the ratio of the quantity of the item valued in 1972 prices to the total output in 1972 prices. Changes in the implicit price deflator reflect both changes in prices and changes in

the composition of output. The chain price index uses as weights the composition of output in the prior period, and therefore reflects only the change in prices between the two periods. However, comparisons of percent changes in the chain index also reflect changes in the composition of output. The fixed-weighted price index uses as weights the composition of output in 1972. Accordingly, comparisons over any time span reflect only changes in prices.

State and Local Government Fiscal Position in 1982

THE State and local government surplus on a national income and product accounting (NIPA) basis was \$31.9 billion in 1982, up slightly from the 1981 surplus. The social insurance funds surplus continued to increase, but its \$4.4 billion increase was almost offset by a swing to an other funds deficit.

Receipts increased about 5 percent, and expenditures slightly more; both showed a considerably slower rate of growth than in the previous year. The deceleration in receipts was caused by the weak economy and by Federal policy decisions reducing grants-in-aid, and occurred despite widespread impositions of higher tax rates by many governments. The deceleration in expenditures occurred in the context of budget shortfalls and took the form of a continued decline in purchases of structures and restraints on employment.

Receipts

State and local government receipts increased about 5 percent in 1982,

down from an 8-percent increase in 1981 (table 1). All five major categories of receipts contributed to the deceleration. Three categories—personal tax and nontax receipts, indirect business tax and nontax accruals, and contributions for social insurance—increased less, and corporate profits tax accruals and grants-in-aid declined more.

Personal tax and nontax receipts increased 9½ percent in 1982, down from 12½ percent in 1981. Income taxes accounted for all of the deceleration. They increased only 7½ percent, after several years of increases averaging more than 10 percent. Legislative actions added more than a percentage point to income tax growth, reversing the post-1976 pattern of holding down growth. For most of this period, indexing held down income tax growth. Indexing continued to have this effect in 1982, but a \$1 billion addition to these taxes by current legislative actions more than offset it. Other types of personal taxes and nontaxes recorded about the same growth as in 1981.

Corporate profits tax accruals declined for the second consecutive year, but the 1982 decline was much sharper—23 percent compared with 4 percent. Although most of the decline stemmed from adverse economic conditions, changes in the Federal tax treatment of depreciation contributed indirectly because many States usually follow Federal treatment. The contribution was probably small, however, because more than one-half of the States imposing such taxes either “decoupled” from the Federal treatment or raised tax rates in an attempt to make up the tax losses that otherwise would have occurred.

Indirect business tax and nontax accruals increased less in 1982 than in 1981. At 8½ percent, the increase was more than the 6½–7 percent recorded in 1978 and 1979, when Proposition 13 and similar measures held down property tax growth. In 1982, sales tax accruals were a major drag on indirect business tax growth; they increased about 5½ percent compared with a 9-percent increase in 1981. In the absence of legislative actions, the

increase would have been about 3 percent. This deceleration was primarily caused by the effect of slower retail sales growth on general sales taxes, for which there was no countering effect in motor fuel, tobacco, and liquor taxes, as demand for these goods remained weak. Unlike the 1981 legislative actions, which were centered on motor fuel tax increases, the 1982 actions involved sales taxes of all types, including both State and local general sales taxes. Wisconsin, Vermont, and Florida raised overall general sales tax rates; Nebraska imposed a temporary rate increase. Washington State, which exempted grocery food sales from the sales tax base in 1978, brought them back in 1982. These changes added about \$1.5 billion to sales tax collections during 1982. Legislative actions increased motor fuel taxes about \$0.5 billion for the second consecutive year. In the absence of these actions, motor fuel taxes would have been virtually unchanged from 1981.

The property tax accrual part of indirect business taxes was the one general own-source receipt that showed notable acceleration in 1982. For most of the 1970's, these taxes, which are largely local, recorded annual increases of 5-7 percent annually, except for 1978 and 1979, when Proposition 13 and related measures held growth to 1 percent. In 1981, the increase accelerated to almost 10 percent, and would have been even

larger had it not been for the imposition of Massachusetts' Proposition 2½, which lowered property taxes about \$250 million. It is likely that the 1982 increase exceeded 11 percent, an exceptionally large increase. After a decade of reductions in average effective rates, in which inflation and real growth in values of taxable property were sufficient to generate needed increases in property tax collections, it appears that many local decision-makers allowed effective rates to move up. Such action may be the necessary response to the combination of the current Federal administration's intent to devolve fiscal responsibility to lower levels of government and the widespread financial troubles in many State governments, which have greatly reduced their ability to finance local government outlays from State resources.

Grants-in-aid declined, even more than in 1981—4½ percent compared with 1 percent. In 1982, grants under the Comprehensive Employment and Training Act (CETA) declined \$1.6 billion, as employment financed by the act was terminated. Other major declines occurred in education grants (\$0.6 billion); and in several construction-related programs (about \$1 billion). Total public assistance grants were up slightly: Medical vendor payments (in part financed by these grants) increased 7 percent, and grants for other assistance programs, including Aid to Families with Dependent Children (AFDC), declined.

Contributions for social insurance increased 10 percent in 1982, compared with 13 percent in 1981. This deceleration was due to a "negative contribution" of about \$0.4 billion in 1980 in the California temporary disability insurance program. Excluding this transaction, increases in contributions would have been about 11 percent in both 1980 and 1981, only slightly more than the 1982 increase.

Expenditures

State and local government expenditures increased 5½ percent in 1982—the smallest increase since World War II. The deceleration from 7½ percent in 1981 was concentrated in the purchase of structures, which declined for the second consecutive year, and in transfer payments to persons (table 2).

Purchases of goods and services increased 6 percent in current dollars, but in constant dollars were down about 1 percent. Compensation of employees increased 7½ percent, down from 9 percent in 1981. Employment declined about 1 percent in 1982, and average compensation was up about 8½ percent.

Public service employment under CETA, which funded more than 500,000 State and local government positions in 1978, came to an end in late 1981. In 1979 and 1980, permanent employment other than education increased rapidly enough to match the decline in CETA employment (chart 6). It seems likely that

better qualified CETA employees—those more easily absorbed into the permanent work force—were “skimmed” off in 1979 and early 1980, as local government managers anticipated continued declines in CETA funds. By 1981, this process was largely complete. Managers either would not or could not, because of deteriorating fiscal positions in many governments, continue to move former CETA employees into the permanent work force. In 1982, as fiscal positions worsened further, State and local new hiring virtually ceased.

The decline in the purchases of structures—slightly over \$2 billion—was concentrated in education construction (\$1.5 billion) and in sewer and utility construction (\$1.3 billion). Declining school population was a factor in the decline of education construction, and uncertainty about the future of Clean Water Act grants was a factor in the decline of sewer and water construction. Purchases of all other types of structures increased slightly. Real structures purchases declined \$1 billion in 1982, following a \$2 billion decline in 1981. Structures prices overall increased only about 1 percent in 1982, reflecting the weak market for construction. Real high-

way construction, about one-third of total State-local structures purchases, increased for only the second time since 1968; prices reflected in bids for highway projects fell about 5 percent in 1982 following a 1-percent decline in 1981. Federal investigations into improper bidding practices, which led to convictions in several States in 1981 and 1982, augmented the effect on prices of the weak market.

Other purchases of goods and services from business increased about 7 percent, following increases that averaged about 12 percent for the 4 previous years. This deceleration largely reflects slower price increases for many categories of goods and services purchases.

Transfers to persons increased 5 percent, compared with 8½ percent in 1981. Direct relief transfers declined slightly, after a 6-percent increase in 1981. A major factor in this decline was the tightening of eligibility requirements for AFDC required by Federal legislation. Limitations on State-controlled cost-of-living adjustments also contributed. Social insurance transfers decelerated only slightly, from 13 to 10½ percent, and other transfers changed very little for the second consecutive year. In the latter group, declines in funds flowing to nonprofit institutions for job training under CETA offset other increases; chief among them was \$0.3 billion representing “dividends” paid by Alaska to residents from oil revenues.

Interest paid in 1982 increased somewhat more rapidly than interest received. Rates for municipal borrowing rose to all-time highs at the beginning of 1982, and remained near those highs through mid-year. Thereafter, rates declined sharply, and long-term municipal borrowing was stepped up, reaching about \$75 billion by the end of 1982. Interest earnings increased almost as rapidly as interest outlays, so net interest paid continued to be a substantial offset to other expenditures.

Fiscal position

The State and local government sector, excluding the operations of social insurance funds, registered a deficit of about \$4½ billion in 1982,

down from near balance in 1981. This deficit was the first sizable one in the

sector since 1975.¹ Its major cause was the poor 1982 performance of major general own-source revenue sources other than property taxes. As it became evident that even modestly optimistic estimates of economic growth during 1982 were too strong, governments began to reduce expenditures and increase taxes. The States of Ohio, Minnesota, and Washington, where weakness in the economy had slowed receipts growth and depleted reserves even earlier, had enacted sizable tax increases in 1981 and found it necessary to increase taxes again in 1982. Michigan, Wisconsin, Oregon, West Virginia, and Vermont imposed higher broad-based taxes in 1982. Florida and Nevada also increased broad-based taxes, although in these cases the purpose was at least partly to fund local property tax reductions rather than to cover immediate budget shortfalls. A number of other States, although able to avoid major changes in broad-based taxes, increased alcohol, tobacco, and other excise taxes. Revenue increases related to mineral wealth (chiefly severance taxes and royalties) slowed or stopped in 1982, forcing budget changes in Texas, Louisiana, and New Mexico. On the expenditures side, the virtual cessation of new hirings, noted above, and a decline in education employment, indicates the extent to which expenditures growth was limited. Minnesota employees took a

1. Although since 1975 there have been surpluses, earlier there were usually deficits. Because capital spending by government is combined with current spending in the summary NIPA presentations and because much of the capital spending by States and localities is funded by long-term borrowing, the “normal” fiscal position of the other funds measure has been a deficit. This and other characteristics of the surplus and deficit in the NIPA framework are discussed more fully in “State and Local Government Fiscal Position in 1978,” in the December 1978 issue of the SURVEY OF CURRENT BUSINESS.

salary reduction, a four-day work week was imposed on Idaho employees, and wage freezes and layoffs occurred in other jurisdictions.

Reductions in Federal grants-in-aid also contributed to the shift into deficit, as did an increase in debt service. (Of the repayment of principal and payment of interest that make up debt service, only the latter is included in the NIPA measure of government expenditures.) The increase in debt service appears to reflect increased reliance on long-term borrowing for capital purposes. Although some of the increased reliance on borrowing appears to be a reaction to reductions in Federal grants, the size of the increase in 1982—almost 50 percent—clearly implies an acceptance of increased debt service well beyond what is required by the grant reduction incurred so far.

Outlook

Receipts growth in 1983, although not strong, will be significantly more than the 5 percent recorded for 1982. The 7-percent increase that seems probable assumes a decline in grants-in-aid of only 2 percent, a substantial increase in corporate profits tax accruals, and an acceleration in broad-based taxes provided by a modest economic recovery. Part of this acceleration will reflect the full-year effect in 1983 of legislative actions taken during 1982. It also allows for changes in Missouri, Indiana, New Jersey, Mississippi, and Minnesota that came into place in January 1983, and for a large California tax package that will be required to avoid a fiscal year 1983 deficit, currently estimated at \$1.6 billion. The 7-percent increase further assumes that certain tax increases temporarily put into place during 1982, and intended to expire during 1983, will be extended (at least through December 1983) and that

property tax accruals will continue to increase about 11 percent. The slower inflation in taxable property values (especially for residential property) and the reduced additions to real property of 1981 and 1982 will work through the assessment process in 1983 and 1984. Slowed increases in assessments will dampen further increases in property taxes if there is not further acceleration in average rate increases. A small boost to 1983 receipts will come in States following the new Federal income tax withholding on interest and dividend earnings.

Expenditures increases will also be larger than the 1982 increase, but will remain well under 10 percent. The downward thrust on employment due to the ending of CETA public service jobs will be absent in 1983, but a downdrift in education employment, which appeared in mid-1982, will probably continue through 1983. Thus, overall employment levels for 1983 will be below those for 1982. Overall compensation will increase about 7 percent. Construction activity is likely to revive somewhat in 1983, despite lower Federal support in general. Very strong long-term borrowing in 1982 and the additional Federal Highway Trust Fund money available after April 1983, which are detailed in the following paragraphs, will contribute to that revival by providing a record amount of construction capital. Medical vendor payments are likely to continue at the relatively slow pace of 1982, in line with the imposition of stricter administrative controls. Other purchases from business will probably match, or slightly exceed, increases in prices for these goods and services. Transfer payments and interest outlays are likely to increase somewhat more rapidly than in 1982, and interest earnings are likely to increase somewhat more slowly.

In 1982, long-term borrowing for public capital increased about \$13 billion. Borrowing was strong, especially in the latter half of 1982, because the

lower rates available after mid-year were regarded as a window of opportunity for borrowers and because Federal legislation required, as of January 1983, that municipal debt be issued in registered form (most municipal issues are now bearer bonds). Many potential issuers expected this requirement to increase administrative costs associated with sales and with making interest payments. Implementation has been delayed until July 1983, but Congress did not approve the delay until the last week of December, and the uncertainty probably brought some issues to market that otherwise would not have been sold until 1983. Further, in December, commercial banks were strong participants in the municipal bond market, probably reflective of their incentive to add tax-exempt securities to their portfolios before December 31, 1982, after which earnings from these securities will be subject to the minimum corporate profits tax.

The 5-cent increase in the Federal gasoline tax (effective April 1, 1983) will significantly increase the revenues of the Federal Highway Trust Fund and provide substantial new funds for highway and transit construction. It is noteworthy that this was the first time Federal Highway Trust Fund receipts were earmarked for transit construction. A part of these Federal funds (about \$1 billion annually) will be available for repair and maintenance work, and should add to outlays of this type after mid-1983. Funds for construction will probably not generate sizable spending increases until near yearend.

The 1983 surplus on an NIPA basis will probably be about \$34 billion, consisting of a social insurance fund surplus of \$41 billion and an all other funds deficit of about \$7 billion. If the assumed recovery is delayed or aborted, or if property taxes are unable to sustain a second consecutive year of 11-percent growth, the other funds deficit will probably reach \$10 billion.

Regional and State Nonfarm Wages and Salaries Thus Far in the 1980's

FROM the first quarter of 1980, the peak quarter of the most recent sustained national business cycle expansion, to the third quarter of 1982, the most recent quarter for which estimates of regional and State personal income are available, nonfarm wage and salary disbursements (payrolls) increased less than the national average in three northern and central regions (Great Lakes, Plains, and Midwest) and more than the national average in four southern and western regions (Southwest, Rocky Mountain, Far West, and Southeast) and in New England.¹ For six of the eight regions,

the pattern thus far in the 1980's was similar to that from 1969 to 1979: the 1969-79 increase in nonfarm payrolls was less than the national average in the Great Lakes and Midwest regions and more than the national average in the four southern and western regions. For two regions, the patterns were different: the 1969-79 increase in nonfarm payrolls was more than the national average in the Plains region and less than the national average in New England.

Thus far in the 1980's, nonfarm payrolls in the Nation increased a modest 18.5 percent.² The first row of table 1 shows, for the Nation, the percent change in nonfarm payrolls by

industry. Construction and durables manufacturing had the smallest increases; the small increase in durables manufacturing payrolls in part reflected weakness in the production of iron and steel, fabricated metals, motor vehicles, and farm equipment. Mining, services, and the finance group had the largest increases. Rows 2-9 of table 1 show, for each of the eight BEA regions, the percent change in nonfarm payrolls by industry. Discussions of the regional percent changes relative to the national percent changes (bottom part of table 1), and the factors that underlie them, follow. In general, the factors reflect the relative contributions to regional nonfarm payrolls of industries with varying rates of production growth nationally. The regional percent changes are discussed in ascending order.

1. Nonfarm wages and salaries, which are the largest component of personal income, are used because, on a quarterly basis, estimates of nonfarm wages and salaries for regions and States are more reliable than estimates of most other components of personal income.

2. Prices, as measured by implicit price deflators for both GNP and personal consumption expenditures, increased about 20 percent.

1. Rows do not sum to 100 percent because other nonfarm payrolls, which consist of payrolls in agricultural services, forestry, and fisheries and payrolls of U.S. residents working for international organizations, are not shown separately.

NOTE.—For rankings of industries and regions, see note to table 1.

In the Great Lakes region, the below-average increase in nonfarm payrolls was mainly accounted for by durables manufacturing. The Great Lakes region had the only regional decline in durables manufacturing payrolls, and the industry's weight, that is, the percent of total nonfarm payrolls accounted for by durables manufacturing, was larger than in any other region (table 2). Within durables manufacturing, iron and steel, fabricated metals, machinery, and motor vehicles had large weights in the Great Lakes region and registered large declines in production. Payroll increases that were smaller than in any other region in nondurables manufacturing, trade, and services and a payroll decline that was larger than in any other region in construction also contributed to the below-average increase. The increase in nonfarm payrolls was below the national average in each Great Lakes State (chart 7). The increases ranged from 5.5 percent in Indiana—ranking 50th among all States—to 10.8 percent in Ohio—ranking 42nd.

In the Plains region, the below-average increase in nonfarm payrolls was mainly accounted for by durables manufacturing, construction, trade, and services. In part reflecting weakness in farm income, payrolls declined in construction and increased at rates that were well below the national average in durables manufacturing, trade, and services. Within durables manufacturing, farm equipment and transportation equipment had large weights in the Plains and registered large declines in production. The increase in nonfarm payrolls was below

the national average in each Plains State except North Dakota. The increases ranged from 6.4 percent in Iowa—ranking 48th among all States—to 25.2 percent in North Dakota—ranking 8th.

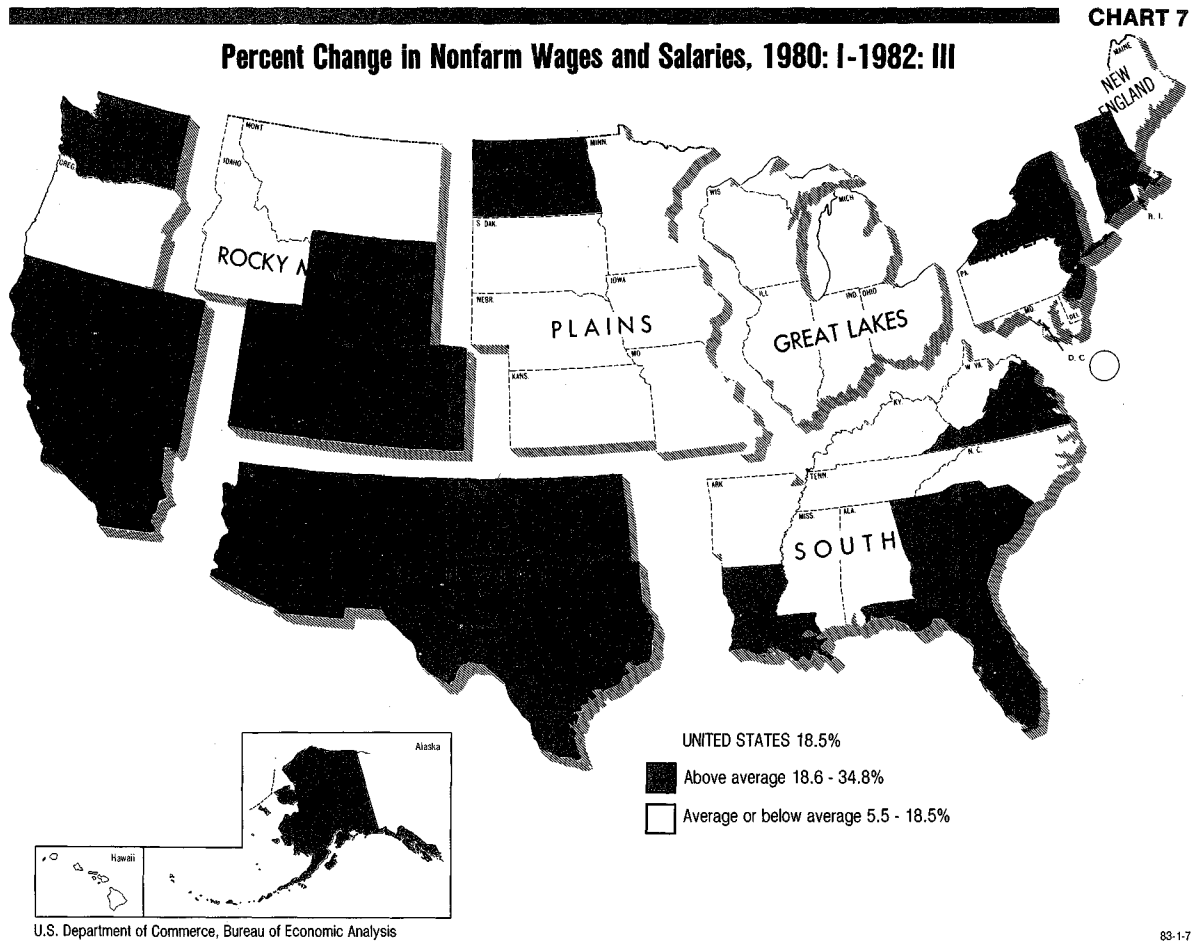

In the Mideast, the below-average increase in nonfarm payrolls was mainly accounted for by durables and nondurables manufacturing and by the Federal Government. The iron and steel and machinery components of durables manufacturing and the chemicals component of nondurables manufacturing had large weights in the Mideast and registered large declines in production. The Mideast's increase in Federal Government payrolls was smaller than in any other region except the Rocky Mountain. The increase in nonfarm payrolls was below the national average in Pennsylvania, Delaware, and Maryland and above the national average in New York and New Jersey. The increases ranged from 9.9 percent in Pennsylvania—ranking 43rd among all States—to 22.0 percent in New York—ranking 16th.

In the Southeast, the above-average increase in nonfarm payrolls was mainly accounted for by construction, durables manufacturing, trade, and both State and local and Federal Government. The Southeast's increase in Federal Government payrolls was larger than in any other region except the Far West, and the industry's weight in the Southeast was larger than in any other region except the Rocky Mountain. Increases in nonfarm payrolls that were above the national average in Florida, Louisiana, Virginia, Georgia, and South

Carolina more than offset below-average increases in the other seven Southeast States. The increases ranged from 30.9 percent in Florida—ranking 3rd among all States—to 9.1 percent in West Virginia—ranking 46th.

In the Far West, the above-average increase in nonfarm payrolls was mainly accounted for by durables and nondurables manufacturing and Federal Government. The payroll increase in durables manufacturing was larger than in any other region except the Southwest. Within durables manufacturing, defense equipment and electronic components had large weights in the Far West, and production in these industries was well maintained. In contrast, lumber, which had a large weight in the Far West, registered a large decline in production. The Far West's increase in Federal Government payrolls was larger than in any other region. The increase in nonfarm payrolls was above the national average in each Far West State except Oregon. The increases ranged from 22.4 percent in Nevada—ranking 13th among all States—to 5.8 percent in Oregon—ranking 49th.

In New England, the above-average increase in nonfarm payrolls was mainly accounted for by durables manufacturing, construction, and the finance group. New England had an increase in durables manufacturing payrolls that was more than twice the national increase, and the industry's weight was larger than in any other region except the Great Lakes. Within durables manufacturing, defense equipment, electronic components, and instruments had large

weights in New England, and production in these industries was well maintained. New England's increase in construction payrolls was larger than in any other region. The increase in nonfarm payrolls was above the national average in each New England State except Rhode Island and Maine. The increases ranged from 26.9 percent in New Hampshire—ranking 7th among all States—to 16.0 percent in Rhode Island—ranking 33rd.

In the Rocky Mountain region, the above-average increase in nonfarm payrolls was mainly accounted for by

construction, durables manufacturing, and private service-type industries. Among private service-type industries, the payroll increase in trade was larger than in any other region except the Southwest. The increase in nonfarm payrolls was above the national average in Colorado, Wyoming, and Utah and below the national average in Idaho and Montana. The increases ranged from 27.7 percent in Colorado—ranking 6th among all States—to 11.6 percent in Idaho—ranking 41st.

In the Southwest, the above-average increase in nonfarm payrolls was ac-

counted for by payroll increases that were larger than in any other region in nearly all industries. In particular, the defense equipment component of durables manufacturing and the petroleum and natural gas component of mining had large weights in the Southwest, and production in these components was well maintained. The increase in nonfarm payrolls was above the national average in each Southwest State. The increases ranged from 34.8 percent in Oklahoma—ranking 1st among all States—to 22.2 percent in Arizona—ranking 15th.

Federal Personal Income Taxes: Liabilities and Payments, 1977-81

THIS article presents quarterly Federal personal income tax liabilities for 1977-81 and explains the sources of the differences between this series and the payment series included in the national income and product accounts (NIPA's). A technical note describes briefly the methodologies underlying the two series, both of which are prepared by BEA. Estimates of these series for 1949-76 appeared in the May 1978 SURVEY OF CURRENT BUSINESS; subsequently the payment series was revised as part of the comprehensive revisions of the NIPA's completed in 1980. Estimates for 1977 and 1978 for both the payment and liability series presented in the March 1980 SURVEY are superceded by those in this article.

There are different timing bases for recording personal taxes. In the NIPA's, personal taxes are recorded on a payment basis, that is, at the time the payments are made by individuals. In the *Monthly Treasury Statement*, published by the Treasury Department, these taxes are recorded on a cash collection basis. BEA also estimates these taxes on a liability basis, that is, when taxpayers earn their income. If one assumes that consumers base their expenditure on income net of tax liabilities rather than on income net of tax payments, it can be argued that the liability basis is more appropriate than either the payment or the collection basis for the analysis of the impact of taxes on consumers and on fiscal policy.

In general, the payment series differs from the liability series for the following reasons: (1) payment of non-withheld taxes—quarterly declarations and final payments—and the payment of refunds by the Treasury do not coincide with liabilities; (2) changes in withholding rates do not always occur at the same time as the

change in liability, and (3) graduated withholding rates can result in changes in taxes withheld different from those in changes in liabilities if the income flow or deductions change during the tax year.

Table 1 shows Federal personal income tax liabilities and payments for 1977-81 and the excess of liabilities over payments. In what follows, the factors affecting these series are explained for 1977-81.

1977.—Three provisions of the Tax Reduction and Simplification Act of 1977 (TRSA) significantly reduced tax liabilities for 1977: (1) a zero bracket

amount was introduced to replace the standard deduction in effect for 1976 and earlier years, (2) the general tax credit was extended to cover exemptions for age and blindness, and (3) a new jobs credit was enacted to encourage businesses to hire additional workers.

On a liability basis, these provisions became effective January 1, 1977, but tax payments were not reduced until withholding rates were reduced on June 1, 1977. As a result, tax payments exceeded liabilities in the first half of 1977 by about \$4.5 billion. In the second half of 1977, the excess of

1. The liability series for 1949-75 appears in the May 1978 SURVEY OF CURRENT BUSINESS; the payment series appears in table 3.4 in *National Income and Product Accounts of the U.S., 1929-76: Statistical Tables*.
 2. This series appears in national income and product accounts table 2.1.
 3. Annual totals appear in *Statistics of Income: Individual Income Tax Returns*.

liabilities over payments was about \$1.5 billion, reflecting the June 1 reduction in withholding rates and continued growth in personal income.

1978.—The excess of liabilities over payments in 1978 was due to heavy refunds resulting from provisions of TRSA. In the first half of the year payments increased \$12 billion—more than 90 percent of refunds are usually made by the end of the second quarter—compared with \$23 billion in the second half.

Tax liabilities were lowered in 1978 by an increase of about \$3 billion in income tax credits—the introduction of the residential energy tax credit and wider use of existing tax credits, such as the investment tax credit, the foreign tax credit, and the targeted jobs credit. The Energy Tax Act of 1978 introduced the residential energy credit retroactive to April 20, 1977. The amount of the residential energy credit claimed in 1978 was \$577 million on \$4.1 billion of energy conservation expenditures and \$125 million of renewable energy source expenditures made from April 20, 1977 to December 31, 1978. However, the credit could not be claimed for any taxable year beginning before January 1, 1978; therefore, the entire amount of the tax credit claimed on energy-saving expenditures in 1977 was shown as reducing tax liabilities in the first quarter of 1978.

The Revenue Act of 1978 was enacted late in the year. Although most of its provisions became effective for tax years beginning after December 31, 1978, some, such as the provision relating to capital gains, became effective in the second half of 1978. The 1978 Act increased the amount of net capital gain that could be excluded from gross income from 50 to 60 percent, effective for taxable transactions occurring after October 31, 1978, and provided for a one-time exclusion from gross income of up to \$100,000 of gain realized on the sale or exchange of a principal residence occurring after July 26, 1978, for taxpayers age 55 or over.

1979.—A sizable decline in liabilities from the fourth quarter of 1978 to the first quarter of 1979 was primarily due to provisions of the Revenue Act of 1978 that became effective January 1, 1979. A reduction in with-

holding rates, which also became effective on the same date, was much less than the reduction in liabilities and thus resulted in unusually large overwithholding for much of 1979. The excess of payments over liabilities averaged about \$11 billion in the first three quarters of 1979.

The Revenue Act of 1978 reduced tax liabilities by widening the zero bracket amount, as well as most other tax brackets; by increasing the amount of the personal exemption from \$750 to \$1,000; and by expanding the earned income credit to cover taxpayers with income under \$10,000 with a maximum credit of \$500. (For 1978, the maximum income level eligible for the earned income credit was \$8,000, with a maximum credit of \$400.) Widening the zero bracket amount and raising the level of the personal exemption reduced taxable income about \$63 billion and tax liabilities about \$12 billion. The expansion of the earned income credit further reduced tax liabilities by about \$0.2 billion.

Several actions partly offset this reduction in liabilities: the general tax credit was allowed to expire, itemized deductions for State and local gasoline taxes and for political contributions were repealed, and a portion of unemployment compensation was made taxable for the first time.

The Foreign Earned Income Act of 1978, also enacted late in 1978, primarily affected personal income tax liabilities for tax years after 1978. A \$15,000 exemption of earned income provided by previous legislation was replaced either with the exclusion of up to \$20,000 of earned income for residents in "hardship" areas or with an adjustment to gross income for an employee's expenses of living abroad. As a result, there was a small increase in liabilities. The amount of exemption, exclusion, or deduction claimed per return filed in 1979 was about \$11,000 per return, down from \$14,000 in 1978.

1980.—In the absence of major tax legislation affecting personal income tax liabilities, both liabilities and payments registered small increases in the first half of 1980, but for different reasons. The small increase in liabilities in the first half is traceable to the recession in 1980. However, the

recession was very mild and lasted only from January to July. Unlike the declines in liabilities registered in past recessions, inflation and continued growth in nominal personal income, through the process of "bracket creep," resulted in a continued increase in liabilities. Although payments tend to exceed liabilities when the rate of income growth is decelerating or when income is declining because they are more responsive to income change, this was not the case during this period. Also, payments in the first half of 1980 slowed sharply due to the decline in net settlements resulting from unusually excessive overwithholding in 1979. In fact, payments declined slightly from the fourth quarter of 1979 to the first quarter of 1980.

The excess of liabilities over payments in the second half of 1980 was due to rising personal income and continued high inflation during the upswing of the business cycle.

1981.—Payments exceeded liabilities by substantial amounts throughout 1981 as new and previously enacted legislation reduced liabilities. The Windfall Profit Tax Act of 1980 broadened the dividend exclusion to include interest and increased the combined exclusion from \$100 to \$200 (\$400 for joint returns). This provision was originally effective for tax years 1981 and 1982, but the Economic Recovery Tax Act of 1981 (ERTA) limited the exclusion to the 1981 tax year only.

The dividend and interest exclusion reduced personal income tax liabilities significantly for 1981. The number of returns with interest received is usually four times as large as the number of returns with dividends, and the amount of interest received per return is higher than the amount of dividends per return for most income classes except the very low and very high classes. By extending the exclusion to the combination of dividend and interest income and by making the maximum exclusion on a joint return unaffected by division of dividend or interest income between the spouses, this act reduced the liability for almost all returns with dividend or interest income.

Liabilities were reduced again in the second half of the year by various

provisions of ERTA. ERTA, enacted in August 1981, provided some reduction in liabilities in the third quarter because certain provisions were retroactive. The maximum tax rate on long-term capital gains from sales or exchanges occurring after June 9, 1981, was reduced to 20 percent, so as not to deter sales or exchanges until 1982, when the maximum individual tax rate drops to 50 percent. Also, the once-in-a-lifetime exclusion of capital gain on the sale or exchange of a principal residence was increased from \$100,000 to \$125,000 effective July 20, 1981. A new tax credit was provided for research and experimentation expenditures made after June 30, 1981. The research tax credit was set at 25 percent of the excess of the qualified research expenses for the year over the average research expenses for the 3 immediately preceding years.

Other provisions of ERTA became effective in the fourth quarter. Individual income tax rates were reduced in that quarter (and in the third quarters of the following 2 years), beginning with a 1.25-percent cut in liabilities in 1981. Individuals were also granted a one-time exclusion of up to \$1,000 for interest on All Savers Certificates issued after September 1981 and before 1983. As a result, the excess of payments over liabilities averaged \$5.3 billion in 1981.

Technical Note

This note describes the methodology underlying the payment and liability series for Federal personal income taxes.

Payment series

Payments of Federal personal income taxes are usually made in three ways—payment through withholding, payment on declarations of estimated tax, and payment due at time of filing a tax return. Most wage earners make tax payments through employer withholdings. Self-employed persons and persons with income from nonwage sources make quarterly payments of estimated tax, net of any credit for overpayment of the previous year's tax liability. When the tax withheld and the quarterly payments

of estimated tax, together with other prepayment credits, are insufficient to cover total tax liability, the amount due is paid at the time of filing a tax return. These payments, along with Federal Insurance Contributions Act (FICA) payments, are deposited in Federal tax and loan accounts at the Federal Reserve banks. When the Federal Reserve banks notify the Treasury of the deposits, personal tax collections are recorded by the Treasury. The time lag between payments by individuals and collections by the Treasury varies from 3 days for large employers to about 1 month for small ones.

The payment series is constructed from Treasury collections data by correcting for the time lag between payments and collections. First, quarterly estimates of combined collections of withheld income taxes and FICA payments are converted to a payments basis by adjusting for the time lag. Next, the FICA component is estimated by use of data on taxable wages supplied by the Social Security Administration and subtracted from the combined payments to arrive at the quarterly payment series of withheld income taxes before seasonal adjustment. The quarterly unadjusted series is summed to obtain annual totals. The seasonally adjusted series is derived by allocating these totals to quarters, largely in proportion to seasonally adjusted wages and salaries. (For the current-period estimates, when annual totals for withheld income taxes are not available, the quarterly series is estimated by multiplying wages and salaries by an effective tax rate derived from Treasury estimates prepared for the annual Federal budget.)

Treasury data for nonwithheld income tax collections and tax refunds are used, without adjustments, for the payment series because timing difference between payments and receipts by the Treasury are considered insignificant. Both nonwithheld income tax collections and refund payments are seasonally adjusted by allocating annual totals to quarters, with allowance for legislative tax changes. In the case of a permanent legislative tax change, the seasonally adjusted series moves to a new level in the first quarter of the calendar

year and continues with a smooth pattern. In the case of a temporary change, the series reflects the underlying unadjusted data. For example, a one-time rebate is not allocated to each of the quarters, but is recorded in the quarter paid. The final income tax series is the sum of withheld and nonwithheld payments, less refunds. It is the major component of the personal tax and nontax series in the NIPA's which is published in NIPA tables 3.2 and 3.4.

Liability series

The personal income tax liability series is based on annual taxable income and tax liabilities published by the Internal Revenue Service (IRS) in *Statistics of Income, Individual Income Tax Returns (SOI)*. This report provides tabulations of information as reported on individual income tax returns filed during a given calendar year based on a stratified systematic sample of returns.

There are several differences between the *SOI* liability series and the BEA liability series presented in this article. The *SOI* series is annual and exclusive of liability changes occurring after initial returns are filed; the BEA series is both annual and quarterly and inclusive of liability changes that result from audits, amended returns, and other additional assessments. In addition, the BEA liability series includes fiduciary tax liability, but *SOI* series does not, and the BEA liability series excludes all liabilities associated with social security tax, but *SOI* series includes the self-employment social security tax and social security taxes on tip income.

The method for generating the quarterly BEA liability series is an extension of the method used by BEA to reconcile annual personal income with annual *SOI* taxable income. (See the December 1976 Survey for a detailed discussion of this reconciliation.) First, a quarterly BEA adjusted gross income (BEA-derived AGI) series is constructed from quarterly personal income by adjusting for conceptual and accounting differences and adding in the portion of *SOI* adjusted gross income (*SOI*-AGI) not included in personal income. The quarterly BEA-derived AGI series is used

to allocate SOI-AGI annual totals to quarters. Next, quarterly estimates of deductions and exemptions are subtracted and quarterly estimates of negative taxable income and the unused zero bracket amount are added to the quarterly SOI-AGI series to derive quarterly taxable income. The quarterly tax liability is estimated by use of an estimated elasticity of tax liability with respect to taxable income. The final liability series is derived by adjusting the

quarterly tax liability series for tax credits (including the credit for excess FICA tax withheld), fiduciary income tax, additional tax for tax preferences, recapture and penalty taxes, audit assessments, and undercoverage of *SOI* data.

The methodology described above was used to estimate the BEA liability series through 1980. Because *SOI* data are not available for 1981, the liability estimate for 1981 is derived by summing withheld and nonwithheld

taxes by liability year based on unpublished Treasury data and subtracting refunds lagged by 1 year. Withheld taxes are almost entirely collected in the liability year, while nonwithheld taxes are collected in the liability year as well as in subsequent years. Refunds mostly represent excess payments for the previous year's liability. The calendar year liability is allocated to quarters by an estimated elasticity of tax liability with respect to personal income.

Plant and Equipment Expenditures, 1983

NEW plant and equipment expenditures planned by U.S. nonfarm business for 1983 total \$315.7 billion, 1.3 percent less than in 1982, according to the annual survey conducted by BEA in late November and December (table 1 and chart 8). Spending for 1982, based on the quarterly survey conducted a month earlier, is \$320.0 billion, 0.5 percent less than in 1981.¹

Prior to the latest survey results, current-dollar "year-ahead" investment plans reported by BEA early in the year have not indicated a decline in the past 20 years; the last such decline was for 1963, based on the January-February survey.

Capital spending after adjustment by BEA for price changes indicates a 5.2-percent decline in 1983 (table 2). A decline of 4.8 percent is indicated for 1982. Real spending increased 0.2 percent in 1981 and 0.9 percent in 1980. Implicit price deflators prepared for the survey data by BEA indicate that prices of capital goods purchased by business in 1982 increased 4.8 percent

and will increase 4.0 percent in 1983. Survey respondents reported a larger price increase for 1982, 7.7 percent, and expect a 7.1-percent increase in 1983 (table 3).²

2. To estimate real spending, the figures reported by survey respondents are adjusted using implicit price deflators for each industry prepared by BEA based on unpublished data in the national income and product accounts. Deflators calculated by BEA for the 1983 spending plans were extrapolated from 1982 deflators using the percentage change in prices in 1982, for each industry, adjusted by the ratios of the expected 1983 price change to the 1982 price change reported by survey respondents. Thus, the procedure incorpo-

rates respondents' expectations that price increases in 1983 will be smaller than the increases in 1982.

Respondents were asked:

"What are your best estimates of average price changes from 1981 to 1982 and expected price changes from 1982 to 1983:

"a. Prices paid by your company for new construction, machinery, and equipment.

"b. Prices of goods and/or services sold by your company."

The companies' responses on capital goods and sales price changes were weighted by their reported capital expenditures and sales, respectively.

1. Planned capital expenditures reported by business in late November and December 1982. Plans for each industry have been adjusted for systematic biases.

2. Includes industries not shown separately.

3. Consists of lumber, furniture, instruments, and miscellaneous.

4. Consists of apparel, tobacco, leather, and printing-publishing.

5. Includes construction; social services and membership organizations; and forestry, fisheries, and agricultural services.

1. For estimates of prior years, see "Revised Estimates of New Plant and Equipment Expenditures in the United States, 1947-77," pages 42-49, in the October 1980 SURVEY OF CURRENT BUSINESS; the December 1980 issue, page 44; and the March 1982 issue, page 25.

The 1982 estimate is based on actual expenditures in the first three quarters and plans for the fourth quarter. The plans, collected by BEA in October and November, were adjusted for systematic biases by procedures described in the October 1980 SURVEY.

The 1983 plans were also adjusted for systematic biases. The net effect of the adjustments was to lower manufacturing \$0.8 billion and to raise nonmanufacturing \$5.3 billion; before adjustment, plans were \$120.3 billion for manufacturing and \$190.9 billion for nonmanufacturing. Bias adjustments were computed separately for each major industry group and were applied only when plans deviated from actual spending in the same direction for at least 5 of the last 7 years. In these cases, the adjustment used was the median deviation between actual and planned spending in the last 5 years.

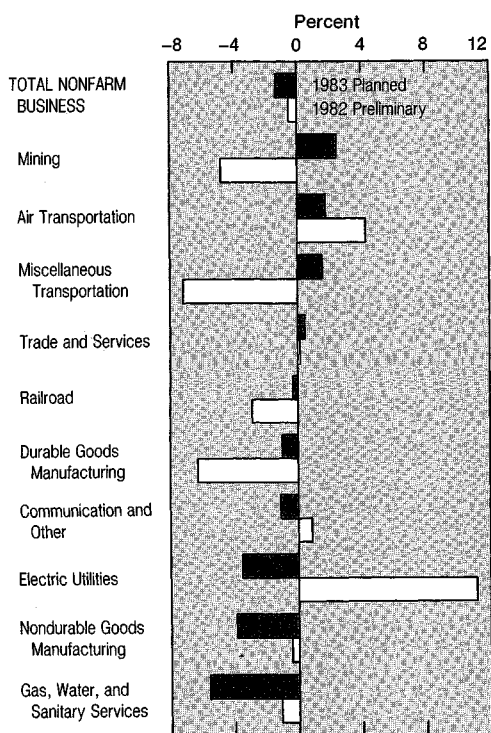

centage points by which the 1982 price increase reported by respondents exceeded the BEA measure is within the range, 1-3½ percentage points, recorded in 12 of the 13 annual surveys conducted since 1969.

The BEA quarterly survey of spending plans conducted in October and November and reported in December indicated an increase of 0.9 percent in current-dollar spending from the second half of 1982 to the first half of 1983. Between the two surveys, economic conditions showed little, if any, improvement, and the latest survey results suggest that first-half plans may have been revised down.

Industry plans

Estimates of planned real spending in manufacturing show a 5.5-percent decline—3.5 percent in durable goods and 7.6 percent in nondurables. Last year, manufacturing spending de-

Sources: Manufacturing data from Bureau of the Census, Current Industrial Reports, Series M-3, for first 11 months of 1982, and BEA estimates for December 1982. Trade data are from the Bureau of the Census, Current Business Reports, Monthly Wholesale Trade and Monthly Retail Trade, and BEA estimates for December 1982. Public utility figures are estimated by BEA on the basis of data collected in the annual business investment surveys.

declined 6.9 percent, with a larger decline in durables. A 5.1-percent decline is estimated for nonmanufacturing, compared with a 3.5-percent decline last year; declines are indicated in all major industry groups this year.

In current dollars, manufacturing industries plan to spend \$119.5 billion in 1983, a 2.6-percent decline; spending in 1982 declined 3.3 percent. The largest planned declines this year are in iron and steel, 19 percent; nonferrous metals, 17 percent; and petroleum, 11 percent. Sizable increases are planned in rubber, 13 percent, and electrical machinery, 10 percent.

Nonmanufacturing industries plan current-dollar spending of \$196.2 billion in 1983, a 0.6-percent decline; spending in 1982 increased 1.3 percent. The largest planned decline this year is in public utilities, 4 percent, following an 8½-percent increase in 1982. Mining firms plan a 2½-percent increase in 1983, after a 5-percent decline.

Sales and sales prices

Manufacturers expect their sales to increase 10½ percent in 1983 (table 4). Sales in 1982 declined 5½ percent, compared with an expected 11½-percent increase. Trade firms expect an increase of 7 percent in 1983; they reported a 1½-percent decline for 1982, compared with an expected 9½-percent increase. Public utilities expect a 15-percent increase in 1983 revenues, compared with an estimated 14 per-

cent in 1982; they had expected a 16-percent increase.

Manufacturers expect the prices of the goods and services they sell to increase at a slightly higher rate in 1983 than in 1982 (table 5). They expect prices to increase 5 percent in 1983, compared with a 4-percent increase in 1982; a year ago, they had expected a 7½-percent increase. Public utilities expect a 12½-percent increase; they reported a 15-percent increase last year, about the same as they had expected.

The Monetary Aggregates:

An Introduction to Definitional Issues

THREE years ago the Board of Governors of the Federal Reserve System redefined the monetary aggregates—the measures of the stock of money in the economy. Since then the meaning of the new aggregates has been altered and their analytical usefulness has been reduced by developments similar to those that prompted the 1980 redefinition. Prominent among these developments is the appearance of new or substantially altered financial instruments and services. As a result, another redefinition of the aggregates may be needed, and it has even been suggested that the use of the aggregates as intermediate targets in monetary policy may have to be abandoned.

This article draws on research conducted, in the main, by Federal Reserve economists over the past few years, to provide an introduction to the issues involved in the definition of the monetary aggregates. The first section describes the factors that prompted the 1980 redefinition and the changes that were made. The second section focuses on the behavior of the aggregates since 1979 and on the major forces that may prompt future modifications of the monetary aggregates.

Aggregates, Old and New

Official estimates of the monetary aggregates are of rather recent origin. Until 1960, Federal Reserve statistics did not include a series labeled “money” or “money stock.” For the next decade, the statistical pages of the *Federal Reserve Bulletin* reported only one such series—currency plus demand (checking) deposits.

During the 1970's increasing emphasis began to be placed on the role of the money stock in the implemen-

tation of monetary policy. It was not clear, however, that currency plus demand deposits was the most useful measure of the money stock. This total, or aggregate, did represent transactions balances, or the medium of exchange, which clearly belonged in any measure of the money stock. A considerable amount of research, however, suggested that the volume of “near-monies”—close substitutes for transactions balances—was also an important determinant of economic activity and, therefore, should be included in measures of the money stock. Unfortunately, there was (and is) no consensus on which, if any, assets besides transactions balances belong in a total called “money.” A number of different totals, therefore, were developed in the early and middle 1970's.

Currency plus demand deposits was designated M1 early in 1971 and two new measures of money were introduced. M2 was defined as M1 plus savings and small-denomination time deposits at commercial banks; M3 was defined as M2 plus deposits at savings and loan associations, mutual savings banks and, later, credit unions.¹ Large negotiable certificates of deposit (CD's) were brought into this scheme in 1975: M4 and M5 were defined as large CD's plus M2, and large CD's plus M3, respectively. These five series were the monetary aggregates that the Federal Reserve Board overhauled in 1980.

Even before this classification scheme was completed, the Board launched a thorough investigation into its shortcomings and possible improvements. This investigation was

prompted in large part by two developments. First, new financial assets were developed in the early and middle 1970's; it was necessary to see if and how these should be reflected in the aggregates. Second, the demand functions for the aggregates showed a pronounced shift at about the same time that the new assets were appearing. This shift was important because it raised questions about the predictability of the effects of monetary policy. In fact, stability of demand is one of the criteria widely used for choosing the monetary aggregate on which to focus. (Another criterion sometimes used is the performance of the aggregates in reduced-form equations relating some important macroeconomic variable, such as GNP, on the one hand, to the aggregate and a fiscal policy variable, on the other.) The first part of the following section begins the discussion of these developments.

Shortcomings in the old aggregates

New financial assets.—Several new types of financial assets were created in the early and mid-1970's. Because these assets possessed some of the characteristics of assets that were included in one or more of the aggregates, the question arose as to whether the new assets should be included in the aggregates and, if so, in which ones. At first, of course, these new assets were quantitatively insignificant; including them in—or excluding them from—the aggregates made little practical difference. It quickly became obvious, however, that these assets would eventually reach sizable proportions, and the question would have to be addressed.

NOW accounts were the first of these new assets. In June 1972, the Massachusetts Supreme Judicial

1. Small-denomination, or simply “small,” time deposits are those in denominations of less than \$100,000. Large-denomination, or “large,” time deposits are those in denominations of \$100,000 or more.

Court ruled that there were no statutory restrictions on the way that withdrawals could be made from savings accounts at State-chartered mutual savings banks. Savings banks in the State soon began issuing savings deposits from which the owner could withdraw funds by writing a negotiable order of withdrawal—hence the acronym. The withdrawal document was a negotiable draft (like a check drawn on a demand deposit at a commercial bank), which could be used to make payments to third parties.

State-chartered savings banks in New Hampshire started offering NOW accounts within a few months of their introduction in Massachusetts. Federally regulated institutions in the two States were immediately at a competitive disadvantage because, like federally regulated institutions in the rest of the country, they were barred from offering NOW accounts. This disadvantage was subsequently removed by Federal legislation (PL 93-100) and amendments to the relevant Federal regulations; effective January 1, 1974, all depository institutions (except credit unions) in Massachusetts and New Hampshire were authorized to offer NOW accounts. By early 1976, Federal legislation authorizing NOW accounts in the rest of the New England States had become effective. These developments, and others related to the emergence of savings-based transactions accounts, are summarized in table 1.

NOW accounts have two important features. First, accounts at savings and loan associations and at savings banks could be used by depositors to pay third parties. The development of NOW accounts, therefore, signaled the end of the virtual monopoly over transactions accounts that commercial banks had previously enjoyed. Second, because the NOW accounts were technically classed as savings accounts, they could earn interest, unlike demand deposits, on which payment of interest was prohibited by the Banking Act of 1933.

Table 2 highlights the difficulty of adequately reflecting NOW accounts in the set of monetary aggregates that existed in the mid-1970's. Old-M1—defined as currency plus demand deposits at commercial banks—was designed to measure transactions balances, and, as a means of making

third-party payments, NOW accounts constituted transactions balances. Because NOW accounts were *savings* accounts, however, they were not included in this aggregate. Old-M2 included some, but not all NOW accounts. NOW accounts at commercial

banks entered the aggregates at this point, but NOW accounts at savings and loan associations and at mutual savings banks entered at the level of old-M3. Old-M3, which included time as well as savings deposits at all depository institutions, was clearly

Table 1.—The Development of Savings-Based Transactions Accounts

1970: September	The Federal Home Loan Bank Board permitted federally chartered savings and loan associations to make preauthorized nonnegotiable transfers from savings accounts to third parties for household-related expenditures.
1972: June	State-chartered mutual savings banks in Massachusetts began offering NOW accounts.
September	State-chartered mutual savings banks in New Hampshire began offering NOW accounts.
1974: January	Federal legislation authorized all depository institutions (except credit unions) in Massachusetts and New Hampshire to offer NOW accounts.
January	First Federal Savings and Loan of Lincoln, Nebraska, installed communications terminals in two supermarkets, enabling customers to withdraw funds from their savings accounts to pay for merchandise purchased from the stores.
August	The National Credit Union Administration permitted Federal credit unions to issue share drafts.
1975: April	The Federal Home Loan Bank Board permitted federally chartered savings and loan associations to make preauthorized transfers from savings accounts to third parties for any purpose.
September	Commercial banks were permitted to make preauthorized nonnegotiable transfers from savings accounts to third parties for any purpose.
November	Commercial banks were authorized to accept savings deposits from partnerships and corporations operated for profit, up to a limit of \$150,000 per customer per bank.
1976: February	Federal legislation extended NOW account authority to all New England States.
1978: October	Federal legislation extended NOW account authority to all New York State.
November	Commercial banks were authorized to offer automatic transfers from savings deposits to demand deposits.
1979: March	U.S. Court of Appeals ruled that automatic transfer accounts were illegal.
1980: March	Federal legislation extended NOW account authority nationwide (effective December 31, 1980) and legalized automatic transfer accounts.

rather far from a measure of transactions balances.

NOW accounts were only one of the innovations in financial markets at this time: Preauthorized transfers, telephone transfers, and automatic transfer from savings accounts and transactions balances at commercial banks, i.e., between old-M1 and old-M2. Further, credit union share draft accounts and demand deposit accounts offered by some mutual savings banks began to reach significant proportions. The share draft accounts, which are transactions balances, entered the old set of aggregates at the M3 level. The demand deposit accounts did not fit neatly into any of the old-M's and, in fact, were not included in any.

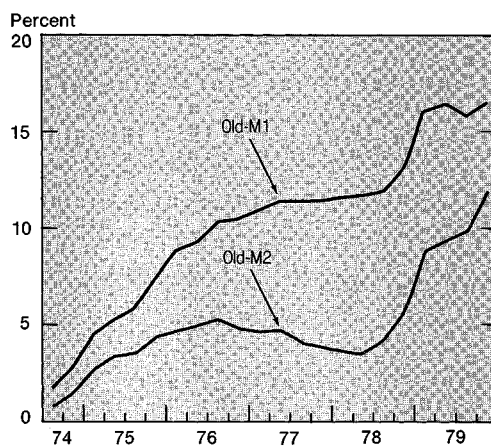

In addition to new types of accounts at depository institutions, other new assets gained prominence in the mid-1970's. During 1974, the number of money market mutual funds rose from 4 to 30, and their net assets climbed from less than \$200 million to \$2½ billion. Most of these funds provided limited check-writing privileges, but because the funds are not classified as depository institutions, shares in the funds were not included in any of the old-M's.²

Overnight repurchase agreements (RP's) also increased in importance in the mid-1970's. Overnight RP's are highly liquid; funds committed to RP's one day can be used to finance transactions the next day. RP's, however, did not fit into the classification scheme of the old aggregates.

While new assets were appearing, older assets were changing. During most of the 1970's, the average maturity of time deposits at commercial banks and other depository institutions lengthened significantly, due to the establishment of higher interest rate ceilings for longer maturity accounts. This lengthening of maturity, along with substantial interest penalties for early withdrawal of time deposits, made time deposits less liquid than they had previously been, and

less liquid than savings deposits. The rationale for including both time and savings deposits in the monetary aggregates at the same level of aggregation—old-M2 for accounts at commercial banks, old-M3 for accounts at nonbank depository institutions—became strained. (The trend toward lengthening maturities of time deposits was reversed with the authorization of 6-month money market certificates in mid-1978.)

Shift in money demand.—Until the mid-1970's, the demand for money was generally thought to be very stable. At the same time that NOW accounts and like assets began appearing, however, evidence began to suggest that there had been a sudden downward shift in the demand for most of the then-existing monetary aggregates. Demand equations that had worked well until that time began to overpredict the level of money demand; the overpredictions were quite large and showed no tendency to be offset by subsequent underpredictions. Simulation of a demand for money equation illustrates these overpredictions. The equation used in this simulation is of the type popularized by Goldfeld:³

$$M_t/P_t = a + b(\text{GNP72}) - c(\text{RPB}) - d(\text{RCP}) + e(M_{t-1}/P_{t-1})$$

3. Stephen M. Goldfeld, "The Demand for Money Revisited," *Brookings Papers on Economic Activity*, No. 3 (Washington, D.C.: The Brookings Institution, 1973), pp. 683-730.

where:

M/P is real (old-)M1 or (old-)M2 balances,
GNP72 is real GNP,
RPB is the weighted average rate on passbook accounts at commercial banks,
RCP is the average rate on 4- to 6-month commercial paper,

and all variables are measured in natural logarithms.

This equation was fitted to data for 1960:IV-1974:II, and was used to "predict" money demand in 1974:III-1979:IV.⁴ For old-M1, the equation consistently overpredicted demand throughout the period (chart 9). A roughly similar pattern of overpredictions is produced by the simulation of the demand for old-M2, although the errors are considerably smaller, especially during 1976-77.

Although simulations such as these certainly suggest a shift in the demand for money, formal statistical tests of the structural stability of the demand function yield confusing, and sometimes contradictory, results. These findings are illustrated in table 3, which reports the results of two common tests—the F test and the cusum-squares test—for the money demand function given earlier. Before examining these results, however, it is important to be clear that it is not the specification of the demand function that is being tested; it is assumed that the Goldfeld-type equation correctly specifies the demand function. More explicitly, it is assumed that the equation

(1) includes all of the important variables that determine the demand for money,

(2) accurately represents the lag patterns of these variables, and

(3) is correct in treating these variables as additive in their logarithms. If one or more of these assumptions is incorrect, which is a possibility raised by a number of writers, probability statements about whether the demand function has shifted based on

the results in table 3 will be unreliable.⁵

With this caveat in mind, the results in table 3 may be examined. The first four rows of the table show that when variables in the equation are measured in levels, statistically significant structural shifts are found by both tests. Row five of the table shows that when variables are measured in levels but the autocorrelation coefficient is constrained to 0.922, no statistically significant shift is discovered by the cusum-squares test. Constraining the autocorrelation coefficient to 0.922 means that the equation is estimated as if the variables were "almost" measured in first differences. (If the autocorrelation coefficient were 1, the results would be identical to estimation of a first-difference specification.) The final three rows of the table show that when variables are measured in true first differences, the F test is unable to detect any structural shift.⁶

Despite the inability of conventional tests to find statistically significant shifts in money demand when the variables are measured in first differences (or "almost" first differences), most researchers and policymakers in the mid-1970's—relying in part on the analysis of prediction errors—had no doubt that a major shift had occurred.⁷ An analysis of the various ex-

5. See, for example, the articles mentioned in R. W. Hafer and Scott E. Hein, "The Shift in Money Demand: What Really Happened?," Federal Reserve Bank of St. Louis *Review* 64 (February 1982) :11-16. See also, William E. Cullison, "Money, the Monetary Base, and Nominal Income," Federal Reserve Bank of Richmond *Economic Review* 68 (May/June 1982) :3-13; and Thomas D. Simpson and Richard D. Porter, "Some Issues Involving the Definition and Interpretation of Monetary Aggregates," *Controlling Monetary Aggregates III*, Conference Series, No. 23 (Boston: Federal Reserve Bank of Boston, October 1980), pp. 161-234.

The caveat also applies to the second section's discussion of possible shifts in money demand during 1980-82.

6. For a discussion of the relative ease of finding structural shifts in equations where the variables are measured in levels (and the relative difficulty of finding shifts in equations where the variables are measured in first differences), see Edward K. Offenbacher, "Discussion of Money Demand Papers at Washington University Workshop," in his "Two Papers on Money Demand," Special Studies Paper 157, (Washington, D.C.: Board of Governors of the Federal Reserve System, Division of Research and Statistics, July 1981), p. 5. (Processed.)

7. Even Hafer and Hein, who point out that no structural shifts are found in first-difference equations, nonetheless conclude that there was indeed a shift in 1974 and that it was the result of a change in the intercept of the money demand equation; they find no evidence of changes in other parameters in the equation. See their "Shift in Money Demand," p. 14.

1. Travelers checks issued by nonbank institutions were included in the aggregates for the first time in June 1981, when data on them became available. Travelers checks issued by banks had long been included in the aggregates as a part of demand deposits.

2. Includes all retail repurchase agreements.

3. The distinction between broker/dealer and general purpose funds, on the one hand, and institution-only funds, on the other, was made in early 1982. Previously, both had been included in new-M2.

4. Excludes all retail repurchase agreements.

planations for the shift in money demand would lead far afield.⁸ Suffice it to say that because the demand function shifted at about the same time that developments in financial markets were altering the meaning of "money", some analysts concluded that these developments caused (at least part of) the shift in money demand. NOW's, ATS's, and RP's, it was argued, satisfied part of the public's demand for "money" without being represented in the measures of money used in estimating money demand equations. This argument was buttressed by the results of further investigations that showed that the shift in money demand appeared

to be localized in the demand deposit component. The obvious solution was to redefine money so that these new instruments would be included in some way.

The new aggregates

The Board of Governors of the Federal Reserve defined five new aggregates in February 1980. Table 4 shows the components of each aggregate, and these components are defined in the accompanying box.

New-M1A differed from old-M1 only in the treatment of certain foreign-owned demand deposits. In the redefined aggregates, all identifiable monetary assets held by foreign commercial banks and official institutions are excluded on the grounds that the demand for them and their effect on domestic macroeconomic variables are substantially different from monetary

8. For such analyses, see R. W. Hafer and Scott E. Hein, "Evidence on the Temporal Stability of the Demand for Money Relationship in the United States," Federal Reserve Bank of St. Louis *Review* 61 (December 1979) :3-14 and the references cited there.

Components of the Monetary Aggregates

Currency: legal tender issued by the U.S. Treasury and the Federal Reserve and circulating outside the Treasury and outside the Federal Reserve banks. Currency held in the vaults of commercial banks is counted as part of bank reserves and not as part of the monetary aggregates. Currency held as vault cash by thrift institutions to service their "other checkable deposit" liabilities is also excluded from the currency component of the aggregates. Other currency held by thrifts—assumed to be used in servicing their savings and small time deposits—is removed as a consolidation adjustment from M2.

Travelers checks: outstanding travelers checks of nonbank issuers. (Bank-issued travelers checks are included in the demand deposit component of the aggregates.) Travelers checks were first included in the aggregates in the June 1982 revision of monetary statistics.

Demand deposits: noninterest bearing checking accounts at all commercial banks except accounts owned by domestic banks, the U.S. Government, and foreign banks and official institutions, less cash items in the process of collection and Federal Reserve float. Demand deposits due to commercial banks are excluded to prevent double counting, as are cash items in the process of collection and float. Demand deposits due to the U.S. Government and to foreign banks and official institutions are excluded because their levels are thought to be determined by fundamentally different factors than other demand deposits and to have fundamentally different effects on the economy. Demand deposits held by thrift institutions to service their "other checkable deposit" liabilities are excluded from the demand deposit component. Other demand deposits of thrifts are removed in an M2 consolidation adjustment.

Other checkable deposits: interest-earning checking accounts, including NOW (negotiable order of withdrawal), ATS (automatic transfer from sav-

ings), and super NOW accounts at commercial banks and thrift institutions, credit union share draft accounts, and demand deposits at mutual savings banks.

Overnight repurchase agreements: borrowings by commercial banks from nonbank customers, in which the banks sell securities one day and buy them back the next business day. As with term repurchase agreements (see below), Federal and Federal agency securities are the principal instruments used in overnight repurchase agreements. Most overnight repurchase agreements are believed to be in amounts of \$1 million or more.

Overnight Eurodollars: dollar-denominated, interest-earning deposits maturing the next business day and held by nonbank U.S. residents in Caribbean branches of member banks.

Money market mutual fund shares: interest-earning, checkable deposits in mutual funds that invest in money market instruments. Shares in general purpose funds and broker/dealer funds are included at the M2 level of aggregation; shares in institution-only funds are included at the M3 level.

Savings deposits: interest-earning deposits, which can usually be withdrawn without prior notice without penalty, at all depository institutions. Interest rate restrictions, now determined by the Depository Institutions Deregulation Committee, are scheduled to be eliminated by 1986, as are interest rate restrictions on time deposits. Since December 14, 1982, includes money market deposit accounts which have limited check-writing privileges and which are not subject to regulatory ceilings on interest rates.

Small denomination time deposits: noncheckable interest-earning deposits, which are subject to substantial forfeiture of interest if withdrawn before maturity, in denominations of less than \$100,000 at all depository institutions.

Large denomination time deposits: interest-earning deposits in denominations of \$100,000 or more at all depository institutions, exclusive of the

holdings of domestic depository institutions, money market mutual funds, the U.S. Government, foreign banks, and official institutions. (Holdings of domestic depository institutions and money market mutual funds are excluded to prevent double counting. Holdings of the other institutions are excluded for reasons akin to those for excluding their holdings of demand deposits from the demand deposit component.)

Term repurchase agreements: borrowings by thrift institutions from nonbank customers, in which the borrowers sell securities with the understanding that the securities will be bought back at a specified date. Most term repurchase agreements are in amounts of \$1 million or more, but retail repurchase agreements, in amounts of less than \$100,000, also exist. Retail repurchase agreements are included at the M2 level of aggregation (in small time deposits); larger term repurchase agreements enter the aggregates at the M3 level.

Other Eurodollar deposits: longer-term dollar denominated interest-earning deposits with maturities of more than 1 day held by nonbank U.S. residents in banking offices outside the U.S. Some overnight Eurodollars are included in this component because the available data do not permit their inclusion in the "overnight Eurodollar" component.

Bankers acceptances: negotiable drafts—orders to pay a specific amount at a specified time—that U.S. banks have formally agreed to honor and that are held by the nonbank public exclusive of the amount held by money market mutual funds.

Commercial paper: unsecured short-term debt obligations of corporations held by the nonbank public, net of holdings by money market mutual funds.

U.S. savings bonds: held by the nonbank public, net of holdings by money market mutual funds.

Short-term Treasury securities: marketable securities issued by the U.S. Treasury that have less than 12 months remaining to maturity.

assets owned by other economic units.⁹

New-M1B included other checkable deposits, such as NOW accounts, ATS accounts, and demand deposits at nonbank depository institutions. New-M1B, it was thought, would probably be superior to M1A as a measure of transactions balances. It was appropriate to exclude NOW accounts and other checkable deposits from the narrowest measure of transactions balances because some of these deposits had turnover rates (about 10 per year) intermediate between the turnover rates of demand deposits (35 per year) and ordinary savings accounts (3 per year). Moreover, if, as in fact did happen, NOW accounts were authorized nationwide, M1B might overstate the public's true transactions balances. M1A, which would understate transactions balances in this event, would aid in estimating actual transactions balances by providing a lower bound.

The broader aggregates represent definitions of money that move progressively further away from transactions balances. New-M2 differs considerably from old-M2. (Table 5 shows the relation between the old and new aggregates.) Savings and small time deposits at nonbank depository institutions, as well as at commercial banks, were included in new-M2, along with overnight RP's, overnight Eurodollars, and shares in money market mutual funds. The last three of these items have some of the characteristics of both transactions balances and liquid investments. The Board decided that, on balance, they were more like investments than like transactions balances. Data on each of the series are published by the Board, however, enabling analysts who disagree with the Board's decision to develop alternative measures of their own. (The relative importance of the various components is shown in chart 10.) Large time deposits and term RP's enter the aggregates in new-M3. L, the broadest of the new aggregates, includes a variety of additional assets,

the largest in a quantitative sense being liquid Treasury obligations.

Aggregation.—The underlying principle of aggregation in the redefined monetary aggregates was that similar kinds of assets should be combined at each level of aggregation. In the old aggregates, the implicit principle had been that similar kinds of assets *issued by similar types of institutions* should be combined at each level.

The new principle had to be compromised from the outset. An extreme example of compromise is the entry at the M2 level of both money market mutual fund shares and 8-year time deposits. The contrast between the limited check-writing privileges of the former and the substantial interest penalties for early withdrawal of the latter, raises the question whether it would not be useful to have an aggregate broader than M1 but including only highly liquid assets with short maturities. "Clearly, [such] a concept . . . would be an attractive alternative or supplement to present broad money measures, but the statistics on remaining maturity of deposits and other similar assets are not available and would be very costly to collect."¹⁰

The degree to which two assets are similar—the key to the aggregation principle—is reflected in the elasticity

of substitution.¹¹ If holders view two assets as excellent substitutes for each other, the elasticity of substitution is very high. Conversely, two assets that complement each other very well will have a large negative elasticity of substitution.

The elasticity of substitution is, of course, exceedingly difficult to estimate, especially in a period of financial innovation such as the 1970's when the elasticity may have been changing. Despite these difficulties, the elasticity estimates in table 6

9. See Helen T. Farr et al., "Foreign Demand Deposits at Commercial Banks in the United States," in *Improving the Monetary Aggregates—Staff Papers* (Washington, D.C.: Board of Governors of the Federal Reserve System, November 1978), pp. 35-54.

10. Stephen H. Axilrod, "Monetary Policy, Money Supply, and the Federal Reserve's Operating Procedures," *Federal Reserve Bulletin* 68 (January 1982):16-17.

11. The elasticity of substitution between assets A and B is measured by the percent change in (A/B) divided by the percent change in (P_B/P_A), where A and B are the amounts of the two assets, in dollars, and P_A and P_B are the (perhaps implicit) yields of assets A and B, respectively.

CHART 10

Components of M2

Data: Federal Reserve Board.

appear reasonable. For households, savings deposits—which are more liquid than time deposits—are closer substitutes for currency and demand deposits than are small denomination time deposits. Time deposits, in fact, appear—on the basis of these estimates—to be complements, rather than substitutes, for the medium of exchange. These estimates taken by themselves, therefore, do not support the practice of having small time deposits and savings accounts enter the aggregates at the same level of aggregation. For businesses, overnight RP's are very good substitutes for demand deposits, and large time deposits are less good substitutes. This finding tends to justify the practice of having RP's enter the aggregates at a lower level (new-M2) than large time deposits (new-M3). One might even argue that the very high elasticity of substitution for RP's suggests that they should enter at an even lower level than new-M2—M1B, say, or some aggregate intermediate between M1B and M2.

Statistical properties.—The redefinition was unsuccessful at removing the apparent shift in money demand in the 1970's. A study prepared at the Board estimated demand equations for each of the old and new aggregates and then used F tests to test the stability of the equations. (Variables were measured in levels.) When the two subperiods 1960:IV–1969:IV and 1970:I–1979:IV were compared, the null hypothesis of stability was rejected at the 5 percent level of significance for every old and new aggregate. When the two subperiods 1960:IV–1974:II and 1974:III–1979:IV were compared, the null hypothesis was rejected for every new and old aggregate except for new-M1A and for the broadest of the old and new aggregates (old-M4, old-M5, and new-L).

Table 7.—Errors From a Dynamic Simulation of Demand Equations for Old and New Monetary Aggregates, 1974:II–1979:IV¹

Aggregate	Mean error	Root mean square error	Aggregate	Mean error	Root mean square error

Old-M2.....	-40.2	48.1	New-M1B.....	-31.4	33.7
Old-M3.....	-71.1	78.4	New-M2.....	.1	12.5
Old-M4.....	-115.0	133.1	New-M3.....	-189.2	221.7
Old-M5.....	-178.8	214.0	L.....	23.7	50.3

1. Errors are in billions of dollars. All equations were estimated over the period 1960:IV–1974:II. The simulation period for L ends with 1979:III; all other simulations go through 1979:IV.

Source: David J. Bennett et al., "Econometric Properties of the Redefined Monetary Aggregates," (Washington, D.C.: Board of Governors of the Federal Reserve System, Division of Research and Statistics, February 1980), table 2-4. (Processed.)

Redefinition also failed to eliminate the overprediction of the demand for the narrow monetary aggregates after 1974:II (table 7). New M2 and L do predict considerably better than their old counterparts, but the reasons for this are mysterious. Recall that the shift in demand for the old-M's was localized in the demand deposit component. The improved predictive performance of new-M2, then, suggests that overpredictions of demand deposits are offset by underpredictions of other liquid asset components of M2. Further statistical analysis suggests savings and small time deposits as the component most likely to have absorbed funds that otherwise would have gone into demand deposits. Demand functions for this component, however, do not generate underpredictions of the size necessary to offset overpredictions in the demand deposit component. Moreover, new-M3's predictive performance deteriorates markedly in the mid-1970's; this should not happen if savings and small time deposits (or other liquid asset components of new-M2) internalized the shift out of demand deposits.¹²

12. See Bennett et al., "Econometric Properties," pp. 26–28, and Neil G. Berkman, "Abandoning Monetary Aggregates," *Controlling Monetary Aggregates III*, conference Series, No. 23 (Boston: Federal Reserve Bank of Boston, October 1980), p. 88.

Lastly, redefinition had little effect on the performance of the aggregates in reduced-form regressions. As noted in the introduction, it is sometimes suggested that the aggregate most highly correlated with the level of economic activity be chosen as "the" money stock. Moreover, reduced-form regressions are sometimes used to infer the effect that changes in the money stock have on the level of economic activity.

Table 8 shows the standard errors from a typical reduced-form equation of current-dollar GNP on alternative monetary aggregates and a fiscal policy variable; it also shows standard errors for regressions in which constant-dollar GNP, the implicit price deflator for GNP, and the unemployment rate are used as the dependent variables.¹³ These last three regres-

13. Reduced-form regressions of this sort frequently have been criticized because of the possibility of "simultaneous equation bias." This bias results if causation in these equations is not unidirectional—i.e., if there are feedback effects from the dependent variable to one of the independent variables. For an early discussion of this issue, see Frank de Leeuw and John Kalchbrenner, "Monetary and Fiscal Actions: A Test of Their Relative Importance in Economic Stabilization—Comment," *Federal Reserve Bank of St. Louis Review* 50 (April 1969): 6–11. A recent investigation concludes that the issue remains unsettled. See, William A. Barnett, Paul A. Spindt, and Edward K. Offenbacher, "Empirical Comparisons of Divisia and Simple Sum Monetary Aggregates," Conference Paper No. 122, NBER Conference Paper Series (Cambridge, Mass.: National Bureau of Economic Research, August 1981), p. 29.

Table 8.—Standard Errors From Reduced-Form Regressions

Dependent variable	Monetary aggregate									Maximum	Minimum	Range

Unemployment rate.....	.411	.415	.424	.396	.397	.431	.424	.28	.411	Old-M4	Old-M3	.035

Notes.—All equations included a fiscal policy variable, defined as the annualized percentage change in high-employment federal expenditures. The monetary and fiscal variables entered the equations with third-degree polynomial distributed lags, constrained to zero at t-5. Sample period: 1970–79.

The aggregates and the dependent variables (except for the unemployment rate) were measured as annualized percentage changes.

Source: Neil G. Berkman, "Abandoning Monetary Aggregates," in *Controlling Monetary Aggregates III*, Conference Series, No. 23 (Boston: Federal Reserve Bank of Boston, October 1980), p. 93.

sions are reported in the belief that real GNP, inflation, and unemployment are the variables of ultimate concern to policymakers.

For each of the dependent variables in table 8, all of the standard errors are relatively large and their range is rather narrow. A pattern is evident, however. Old-M4 produces the largest standard errors for all of the dependent variables, new-L produces the smallest standard errors for both current-dollar and real GNP, and old-M3 yields the smallest standard errors for inflation and unemployment.¹⁴ (New-L, it may be noted, is perhaps least amenable to control by the monetary authorities of all the old and new aggregates.)

Of the other new aggregates, new-M1 produces the smallest standard error for current-dollar GNP and new-M2 produces the smallest standard errors for the other dependent variables. In no instances are these standard errors much, if any, smaller than the standard errors produced by some of the old aggregates. Redefining the aggregates, therefore, had little effect on their performance in reduced-form equations estimated with data for the 1960's and 1970's. It may well be, of course, that the new aggregates would outperform the old aggregates subsequent to 1979.

Developments in 1980-82

During 1980-82, some of the innovations of the preceding decade assumed new importance; in addition, new financial instruments and services made their appearance. In this section, these developments are described and then the growth of the aggregates and the stability of money demand during the past few years is discussed.

14. A comparison of the standard errors produced by the various aggregates should be understood as suggestive rather than conclusive. The comparisons would be strictly legitimate only if the estimated coefficients of autocorrelation in each regression were identical. Although the source for table 8 does not report these coefficients, it is highly unlikely that this condition is met.

Innovations in financial markets

The Depository Institutions Deregulation and Monetary Control Act of 1980 authorized the nationwide issuance of NOW accounts, effective December 31, 1980. In the first two months of 1981, "other checkable deposits"—in which NOW's are included—roughly doubled, rising \$26½ billion, as funds flowed into NOW accounts from demand deposits and from savings accounts. Over the entire year, other checkable deposits increased \$50 billion, while demand deposits fell \$31 billion (11½ percent).

Not all of the increase in other checkable deposits was at the expense of demand deposits. There were two important reasons for assuming, early in 1981, that a sizable part of the increase in NOW accounts would actually serve as savings, rather than transactions, balances. First, many depository institutions required relatively large minimum balances in NOW accounts; it was reasonable to assume that individuals would cover at least part of this requirement by shifting funds out of savings balances. Second, the experience with NOW accounts in New England had been that roughly one-third of flows into NOW accounts and ATS accounts had represented shifts of funds out of savings balances and other non-M1 sources.

The Federal Reserve estimated that 22½ percent of the flows into newly opened NOW accounts in January 1981, and 27½ percent in February-December, came from non-M1 sources. This amount was subtracted from M1B in order to obtain "shift-adjusted M1B," which was then used as the basic measure of transactions balances.¹⁵ Shift-adjusted M1B was the focus of most monetary policy discussions in 1981. By the end of 1981, the shift into M1 attributable to NOW accounts was concluded to have run its course. The shift adjustment was discontinued as of January 1982, M1A was dropped from the list of aggregates, and M1B was rechristened M1.

15. An explanation of the method of calculating shift-adjusted M1B is given in Daniel L. Thornton, "The FOMC in 1981: Monetary Control in a Changing Financial Environment," Federal Reserve Bank of St. Louis Review 64 (April 1982): 4.

Several new assets have appeared since early 1980. Effective October 1, 1981, All Savers Certificates were authorized, with 12-month maturities and limited tax exemption of interest earnings. In the spring of 1982, 91-day certificates of deposit—with yields tied to those on Treasury bills—were introduced at depository institutions. Beginning May 1982, depository institutions were authorized to offer negotiable and nonnegotiable certificates of deposit with maturities of 3½ years or more, with no restrictions on their yields. Effective September 1982, depository institutions were permitted to offer certificates with maturities of from 7 to 31 days with yields linked to Treasury securities. Presumably all of these certificates compete mainly with other short-term liquid assets—money market mutual fund shares, retail repurchase agreements, and other certificates of deposit—already included in M2. If so, the level and rates of change of the broad aggregates will be little affected, although the composition of M2 could change.

Two points should be noted about these new instruments. First, they represent a continuation of the movement toward the deregulation of the yields on time deposits at depository institutions. (All deposit rate ceilings are scheduled to be eliminated by 1986 in accordance with the provisions of the Depository Institutions Act.) In early 1978, less than 5 percent of the non-M1 components of M2 bore market-related yields; by early 1982, this share had risen to over 64 percent.¹⁶ The sensitivity of M2 with respect to changes in market interest rates, therefore, has decreased substantially. This decreased sensitivity is well illustrated by M2 growth in 1981. Interest rates were high throughout the year, but especially during the summer. The rate on 3-month Treasury bills, for example, rose from 13.6 percent in April to an average of 15.2 percent for May

16. David E. Lindsey, "Recent Monetary Developments and Controversies," *Brookings Papers on Economic Activity*, No. 1 (Washington, D.C.: The Brookings Institution, 1982), p. 252.

through September. In earlier years, such rates would have led to large movements of funds out of low yielding M2-deposits and into market instruments. In 1981, however, the non-M1 components of M2 increased at an 11 percent annual rate from April to September, the same rate as in the previous five months (when rates had averaged 75 basis points lower) and much faster than M1 itself (which actually decreased at a 1 percent annual rate).

Second, the quantitatively most significant certificates of deposit are 6-month money market certificates (MMC's). The popularity of MMC's has shortened the average maturity of time deposits, making time deposits more liquid and, therefore, better substitutes for transactions balances. Some of the other certificates are tending to have the opposite effect, however. In particular, funds in individual retirement accounts and Keogh Plan accounts are quite illiquid, given the tax penalties that attach to premature withdrawal.

Deposit "sweeping" arrangements have spread in recent years. Such arrangements provide that when transactions balances rise above a specified level, the excess funds are to be invested in short-term, highly liquid assets bearing market-determined rates of return. (The sweeping may, depending on the terms of the agreement, be done by the customer or automatically by the bank.) Conversely, when transactions balances fall below a specified level, liquid assets are to be sold and the proceeds put into the transactions account.

Deposit sweeping is presently of importance primarily to large companies although the practice is now being used by increasing numbers of medium-sized and small businesses. Deposit sweeping is also a characteristic of many cash management accounts offered to individuals by brokerage firms, and some depository institutions have begun to offer the service to retail customers.

The president of the Federal Reserve Bank of Boston has suggested that if deposit sweeping continues to spread, it will have serious implications for the measurement and interpretation of the monetary aggregates.¹⁷

Funds in sweep accounts are clearly transactions balances from the point of view of the owners of the accounts; the funds are available for spending each morning. By close of business, however, a substantial portion of transactions balances may have been swept. Because the monetary aggregates are measured on the basis of balances at the close of business, they underestimate the volume of transactions balances. If the prevalence of deposit sweeping spreads, the seriousness of this underestimation will increase.

The principal reason for holding funds in a sweep account, of course, is to earn interest on transactions balances. This reason has been undercut by recent actions of the Depository Institutions Deregulation Committee. Effective December 14, 1982, depository institutions were authorized to offer money market deposit accounts. Effective January 5, 1983, depository institutions were authorized to offer "super NOW accounts." Money market deposit accounts carry limited check-writing privileges (three per month), while super NOW accounts are true transactions accounts. The minimum balance for both types of account is \$2,500 and both are free of restrictions on interest rates that may be paid. The authorization of these two new accounts substantially reduces the incentive for individuals to hold sweep accounts. Corporations, which are not now permitted to own super NOW accounts, continue to have an incentive to hold sweep accounts. The Depository Institutions Deregulation Committee, however, is currently considering a proposal to permit corporate accounts like super NOW's. If such an account is authorized, corporations too may have little reason to use sweep accounts.

The Garn-St Germain Depository Institutions Act of 1982—which has been called the most important legislation for financial institutions in 50 years—required the Depository Institutions Deregulation Committee to

authorize an account that would be directly competitive with money market mutual funds. The money market deposit account was the committee's response to this directive.

It is generally expected that money market deposit accounts will offer yields somewhat higher than those offered by the money market mutual funds, at least initially, in order to attract deposits. Depository institutions may be able to afford to offer a higher rate because they can invest in longer term, higher yielding assets than the money market funds can. ("Borrowing short and lending long," of course, would expose the institutions to possibly severe earnings pressures if the term structure of interest rates were to turn negative.) Nonrate considerations may also favor the depository institutions—the availability of Federal deposit insurance, for example, and the convenience of dealing with a local institution instead of one located in a distant city. Competition between depository institutions and money market mutual funds, of course, can be expected to affect primarily the composition of M2 rather than its level. There could well be some spillover effects, however, in which funds invested in, say, Treasury bills, would be drawn into M2, raising its level.

Money market deposit accounts, it is important to note, continue the trend mentioned earlier toward reducing the interest rate sensitivity of the M2 total. With rates completely free of ceilings, it is much less likely that funds will flow out of depository institutions when market interest rates rise. The coefficient of interest rates in demand for M2 equations, therefore, can be expected to fall.

Similarly the coefficient of interest rates in demand for M1 equations can be expected to fall now that transactions balances free of interest rate ceilings are available. Also, it is clearly possible that some inflows into super NOW accounts will draw funds from assets that are not included in M1, so that both the composition of M1, its level, and the composition of the broader aggregates will be affected.

Monetary growth in 1980-82.—The Federal Open Market Committee sets fourth-quarter to fourth-quarter

17. Frank E. Morris, "Do the Monetary Aggregates Have a Future as Targets of Federal Reserve Policy?," *New England Economic Review* (March/April, 1982): 5-14.

target ranges for the growth rates of M1, M2, and M3. (The committee also sets a target range for the growth rate of bank credit, which this article will ignore. No target is set for L.) The growth rate targets for the M's are shown in the left-hand panels of chart 11, along with the actual rates of growth of the M's from November

of the preceding year.¹⁸ The levels of the aggregates are shown in the right-hand panels, along with the range of levels implicit in each growth rate target. This chart illustrates two of

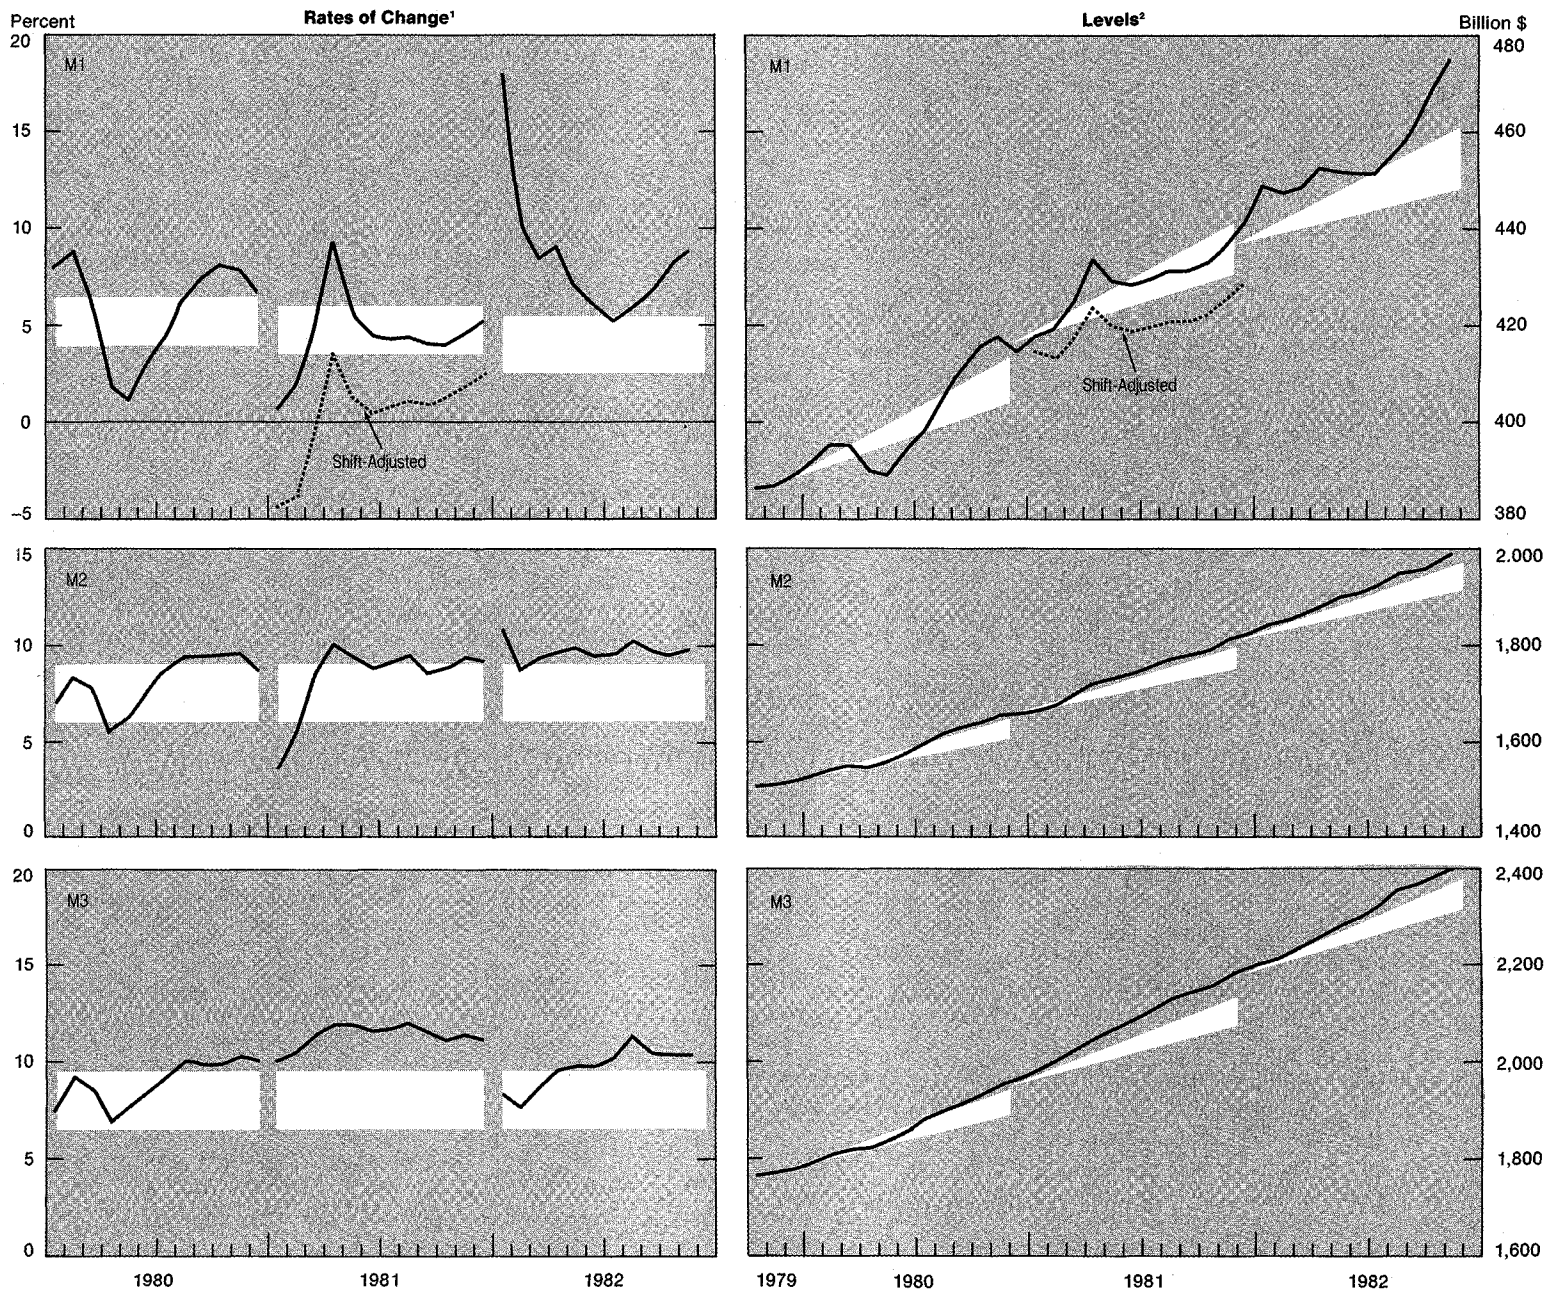

the most important issues relating to monetary growth in the past few years.

First, short-term variations in growth rates of the aggregates have been quite substantial. M1 growth has exhibited the largest such variation, but the broader aggregates have also exhibited large swings. Hein esti-

18. The chart would not be changed much if the fourth-quarter average levels of the M's, instead of the November levels, were used as the bases for calculating the rates of growth.

CHART 11

M1, M2, and M3

1. White areas show growth rate ranges established by the Federal Open Market Committee. Lines show actual percentage changes (at seasonally adjusted annual rates) from November of preceding year.

2. White areas show levels implicit in ranges established by the Federal Open Market Committee. Lines show actual levels.

Data: Federal Reserve Board.

mates that M1 growth—measured as deviation from trend—was more volatile in the second and third quarters of 1980 than at any other time in at least 20 years.¹⁹ Some have interpreted this volatility as indicative of shifts in the demand for money and have concluded that, because money demand cannot be forecast reliably, the use of aggregates as intermediate targets of monetary policy should be abandoned. Others contend that the volatility is better explained by developments affecting the supply of money—developments such as the credit control program in the spring of 1980 and the change in the Federal Reserve's operating procedure in the fall of 1979. If this latter interpretation is correct, the Federal Reserve need only abandon those practices that caused the volatility.

The second issue illustrated in chart 11 is the divergent behavior of the various aggregates—divergent behavior that complicates the tasks of formulating and analyzing monetary policy. In 1981, for example, shift-adjusted M1 increased along a path that was below the lower limit of the range set by the Committee. M2 and M3, in contrast, increased along a path that was at or above the upper limit. Was money very tight, as suggested by the shift-adjusted M1 path, or was it not so tight, as suggested by paths of the broader aggregates? Further, although shift-adjusted M1 was well short of its targeted growth path during most of 1981, unadjusted M1 was comfortably within that range.²⁰ If M1, rather than shift-adjusted M1, was a better measure of transactions balances in 1981, then the discrepancy between the growth rates of transactions balances and the broader aggregates is reduced substantially.

Short-term growth rate variations in 1981 are also related to the shift-adjustment issue. If the shift-adjusted measure of M1 is used, growth fell from 11.1 percent in the fourth quar-

ter of 1980 to -0.9 percent in the first quarter of 1981; if the unadjusted measure is used, growth fell from 11.1 percent in the fourth quarter of 1980 to 4.6 percent in the first quarter of 1981.

As explained earlier, the shift adjustment was an estimate of the amount of the increase in other checkable deposits that came from sources other than demand deposits. One interpretation of the adjustment is that such funds would be idle balances and that they would have to be netted out of M1 to obtain an accurate measure of transactions balances. In calculating the shift adjustment, the staff of the Federal Reserve Board relied on surveys of depository institutions, surveys of households, and cross-sectional econometric analysis of changes in demand deposits and changes in other checkable deposits.

Some critics have concluded that the shift adjustment thus calculated was much too large. They maintain that unadjusted M1 was a better measure of transactions balance in 1981 than shift-adjusted M1.²¹ Using the unadjusted measure, the increase in velocity of M1 in 1981 is much less than the increase calculated using adjusted M1. The demand for M1, there-

fore, appears to be more stable if the shift adjustment is ignored.

Defenders of the shift adjustment explain the velocity behavior of adjusted and unadjusted M1 by hypothesizing a downward shift in money demand—a shift about equal in size, but otherwise unrelated, to the shift adjustment. Lindsey, for example, suggests that the increased use of money market fund shares for transactions purposes, the economizing on transactions balances induced by the high yield and liquidity of money market funds, and the further spread of improved cash management practices all are important for an understanding of 1981's velocity behavior. Many other analysts and policymakers have also hypothesized recent shifts in money demand.²²

To examine the possibility of a recent shift, a Goldfeld-type demand equation was estimated in both level and first-difference forms for 1959:III-1979:IV. (This equation was identical to the one discussed earlier except that the average rate on time deposits

21. See, for example, John A. Tatom, "Recent Financial Innovations: Have They Distorted the Meaning of M1?" Federal Reserve Bank of St. Louis *Review* 64 (April 1982):23-35, and Cullison, "Money, the Monetary Base, and Nominal Income," p. 6.

1. All variables, except D, are in first differences. Figures in parentheses are t-statistics.

2. D has a value of zero throughout this subperiod and, therefore, cannot be included in the regression.

19. Scott E. Hein, "Short-Run Money Growth Volatility: Evidence of Misbehaving Money Demand?," Federal Reserve Bank of St. Louis *Review* 64 (June/July 1982):28.

20. The Committee did not establish a growth rate range for unadjusted M1 in 1981. The Committee did, however, anticipate (accurately, as it turned out) that unadjusted M1 growth would be about 2½ percentage points higher than the growth rate of shift-adjusted M1.

was substituted for the average rate on passbook accounts.) Both forms were then used to make static simulations of money demand in 1980:I-1982:I. In each case, the root mean square error of the simulation was more than triple the standard error of estimate of the associated regression, lending support to the suggestion that there has been at least one shift in the demand for M1 since 1979.

In a more formal analysis, the first-difference form of the equation was estimated for 1959:III-1982:I and an F test was performed to test for a shift in the first quarter of 1980. (For 1981, both shift-adjusted and unadjusted M1 were used.) The results are striking (table 9). The coefficients for the 1980:I-1982:I period bear no resemblance to those of the earlier period. The F-statistic (distributed with 6 and 79 degrees of freedom) was 9.44 for unadjusted M1 and 5.93 for shift-adjusted M1, both far above the critical level (3.07) for the 1-percent level of significance; the null hypothesis (stable money demand) is rejected. The high F-statistics in these tests are the more remarkable when it is recalled that the F test is frequently not

powerful enough to identify shifts in first-difference equations.

The post-1979 instability in money demand differs importantly from the 1974 shift, which led to large and consistent overprediction of the demand for money. Since 1979, there have been large overestimates for some quarters, but there have also been large underestimates for some others. The bias in the estimates is quite small. The fact that over- and underestimates have tended to cancel each other out may be viewed as justifying the aggregates as intermediate targets of monetary policy. The recent instability may be viewed as indicating the futility of using monetary policy to "fine-tune" the economy from quarter to quarter, but it may be compatible with the possibility of "gross-tuning" from year to year, say, or from cycle to cycle.

Another way to justify the role of the monetary aggregates, of course, is to deny that even the quarterly volatility in monetary growth since 1979 has been due to shifts in money demand and to argue that it has been due to supply side disturbances. Those who have taken this tack point to the

credit control program that the Federal Reserve Board administered in the spring of 1980 and to the change in the Federal Open Market Committee's operating procedures in the fall of 1979.²³ If, as has been argued, these developments created an imbalance between the amount of money demanded and the amount supplied, then the F tests reported above are invalid. Detailed examination of this issue would entail an investigation of monetary control, which is outside the scope of this article. Without such an investigation, about all that can be said—unsatisfying though it may be—is that the question of monetary stability since 1979 is still open.

23. See, for example, Hein, "Short-Run Money Growth Volatility," and the references cited therein, and Allan H. Meltzer, "The Results of the Fed's Failed Experiment," *Wall Street Journal*, July 29, 1982, editorial page. Meltzer does not explicitly rule out the possibility of a shift in demand but does say that since "the experiment began in October 1979, the volatility of money growth . . . has been raised . . . more than necessary."

Note that the credit control program can be viewed as affecting not the supply of money, but rather the demand for money. See, *The New Monetary Control Procedures—Federal Reserve Staff Study*, (Washington, D.C.: Board of Governors of the Federal Reserve System, 1981).

REVIEWING THE STATE OF THE NATION'S ECONOMY

SURVEY is for businesspeople, government administrators, trade association executives, union officials, economists, statisticians, market researchers, and anyone else who wants to know, month by month, *the state of the Nation's economy*.

SURVEY carries articles on special subjects, such as State personal income, corporate profits, business programs for new plant and equipment, foreign trade, Federal government receipts and expenditures, and current price developments.

SURVEY issues show more than 2,500 statistical series for each month of the past year or for each quarter over the past several years, plus annual data for recent years.

12 monthly issues of from 48 to 72 pages, including about 36 of tabular material, with special supplements appearing from time to time. Annual subscription: second-class mail—\$30.00 domestic; \$37.50 foreign. Single copy: \$4.75 domestic; \$5.95 foreign.

CURRENT BUSINESS STATISTICS

THE STATISTICS here update series published in the 1979 edition of BUSINESS STATISTICS, biennial statistical supplement to the SURVEY OF CURRENT BUSINESS. That volume (available from the Superintendent of Documents for \$9.50, stock no. 003-010-00089-9) provides a description of each series, references to sources of earlier figures, and historical data as follows: For all series, monthly or quarterly, 1975 through 1978, annually, 1947-78; for selected series, monthly or quarterly, 1947-78 (where available).

The sources of the series are given in the 1979 edition of BUSINESS STATISTICS; they appear in the main descriptive note for each series, and are also listed alphabetically on pages 171-172. Series originating in Government agencies are not copyrighted and may be reprinted freely. Series from private sources are provided through the courtesy of the compilers, and are subject to their copyrights.

Unless otherwise stated in footnotes below, data through 1978 and descriptive notes are as shown in the 1979 edition of BUSINESS STATISTICS	1980	1981	1981		1982

General Notes for all Pages:

- r Revised.
- p Preliminary.
- e Estimated.
- c Corrected.

Page S-1

† Revised series. See Tables 2.6 - 2.9 in the July 1982 SURVEY for revised estimates back to 1977. Pre-1977 estimates are available in *The National Income and Product Accounts of the United States, 1929-76: Statistical Tables*.

‡ Includes inventory valuation and capital consumption adjustments.

* New series. Detailed descriptions begin on p. 18 of the Nov. 1979 SURVEY. See note "†" for this page for information on historical data.

§ Monthly estimates equal the centered three-month average of personal saving as a percentage of the centered three-month moving average of disposable personal income.

Page S-2

1. Based on data not seasonally adjusted.

Includes data not shown separately.

‡ Revised series. For wholesale see note "‡" for p. S-8. For manufacturing see note "†" for p. S-3. For retail see note "†" for p. S-8.

† See note "†" for p. S-3.

§ See note "†" for p. S-8.

@ See note "‡" for p. S-8.

* New series. Data back to 1967 are available from the National Income and Wealth Division, Bureau of Economic Analysis.

Page S-3

‡ Revised series. For wholesale see note "‡" for p. S-8. For manufacturing see note "†" for this page. For retail see note "†" for p. S-8.

† Revised series. Data have been revised back to 1972. A detailed description of these revisions and historical data appear in the reports "Manufacturers' Shipments, Inventories, and Orders" M3-1.10 (1972-1980) and M3-1.11 (1977-81), available from the Bureau of the Census, Washington, D.C. 20233.

§ See note "†" for p. S-8.

@ See note "‡" for p. S-8.

* New series. Data back to 1967 are available from the National Income and Wealth Division, Bureau of Economic Analysis.

Includes data for items not shown separately.

Page S-4

1. Based on data not seasonally adjusted.

† See note "†" for p. S-3.

Includes data for items not shown separately.

‡ Includes textile mill products, leather and products, paper and allied products, and printing and publishing industries; unfilled orders for other nondurable goods industries are zero.

¶ For these industries (food and kindred products, tobacco, apparel and other textile products, petroleum and coal, chemicals and allied products, and rubber and plastics products) sales are considered equal to new orders.

Page S-5

1. Based on unadjusted data.

† See note "†" for p. S-3.

@ Compiled by Dun & Bradstreet, Inc.

Includes data for items not shown separately.

§ Ratio of prices received to prices paid (parity index).

¶ Revisions, back to 1975 for some commodities, are available upon request.

‡ See note "‡" for p. S-4.

Page S-6

§ For actual producer prices of individual commodities see respective commodities in the Industry section beginning p. S-19. All data subject to revision four months after original publication.

† Revised series. Stage-of-processing producer price indexes have been revised back to 1976 to reflect updated industry input-output relationships and improved classification of some products.

Includes data for items not shown separately.

‡ Effective Feb. 1982, data have been revised back to 1977 to reflect new seasonal factors.

Page S-7

1. Computed from cumulative valuation total.

2. Index as of Jan. 1, 1983: building, 342.0; construction, 368.7.

Includes data for items not shown separately.

§ Data for Jan., Apr., July, Sept., and Dec. 1982 are for five weeks; other months four weeks.

Page S-8

1. Advance Estimate.

¶ Home mortgage rates (conventional first mortgages) are under money and interest rates on p. S-14.

§ Data include guaranteed direct loans sold.

‡ Effective Oct. 1982 SURVEY, seasonally adjusted wholesale trade data have been revised for Jan. 1981-March 1982. Effective April 1982 SURVEY, wholesale trade data have been revised for Jan. 1972-Dec. 1981. Revised data are available upon request.

† Effective April 1982 SURVEY, retail trade data have been revised for the years 1972-1981. Revised data and a summary of the changes are available from the Census Bureau, Washington, D.C. 20233.

Includes data for items not shown separately.

Page S-9

1. Advance estimate.

2. Effective Jan. 1979 data, sales of mail-order houses are included with department store sales.

3. As of July 1.

Includes data for items not shown separately.

‡ Revisions for Jan. 1977-Oct. 1979 appear in "Current Population Reports," Series P-25, No. 870, Bureau of the Census.

¶ Effective with the January 1983 SURVEY, the seasonally adjusted labor force series have been revised back to January 1978. Revised monthly series appear in the January 1983 issue of *Employment and Earnings*. Effective with the February 1982 SURVEY, the labor force series have been revised back to 1970 to reflect the 1980 Census of Population. Seasonal adjustment factors were revised accordingly. Revised monthly series appear in the February 1982 issue of *Employment and Earnings*. Revised annual series will appear in the March 1982 issue of *Employment and Earnings*, U.S. Department of Labor, Bureau of Labor Statistics.

* New series. The participation rate is the percent of the civilian noninstitutional population in the civilian labor force. The employment-population ratio is employment as a percent of the total noninstitutional population, 16 years and over.

† See note "†" for p. S-8.

Page S-10

† Effective June 1982 SURVEY, data have been revised back to 1977 based on March 1981 benchmark levels and updated seasonal adjustment factors. See "BLS Establishment Estimates Revised to March 1981 Benchmarks," in the June 1982 issue of *Employment and Earnings*. Effective July 1981 SURVEY, data have been revised back to 1974 to reflect new benchmarks and new seasonal adjustment factors. See "BLS Establishment Estimates Revised to March 1980 Benchmarks," in the July 1981 issue of *Employment and Earnings*.

¶ See note "¶" for p. S-9.

Page S-11

† See note "†" on p. S-10.

‡ This series is not seasonally adjusted because the seasonal component is small relative to the trend-cycle and/or irregular components and consequently cannot be separated with sufficient precision.

¶ Production and nonsupervisory workers.

Page S-12

1. This series has been discontinued.

† See corresponding note on p. S-10.

¶ Production and nonsupervisory workers.

‡ Earnings in 1977 dollars reflect changes in purchasing power since 1977 by dividing by Consumer Price Index.

§ Wages as of Jan. 1, 1983: Common, \$14.86; Skilled, \$19.34.

Page S-13

1. Average for Dec.

¶ Effective April 1982 SURVEY, the series for work stoppages involving six or more workers have been discontinued and have been replaced by series for work stoppages involving 1,000 or more workers.

Includes data for items not shown separately.

§ For demand deposits, the term "adjusted" denotes demand deposits other than domestic commercial bank and U.S. Government, less cash items in process of collection; for loans, exclusive of loans to and Federal funds transactions with domestic commercial banks and include valuation reserves (individual loan items are shown gross; i.e. before deduction of valuation reserves).

* New series. Beginning Dec. 1978, data are for all investment account securities; comparable data for earlier periods are not available.

@ Insured unemployment (all programs) data include claims filed under extended duration provisions of regular State laws; amounts paid under these programs are excluded from state benefits paid data.

@@ Insured unemployment as a percent of average covered employment in a 12-month period.

Page S-14

1. Data are for fiscal years ending Sept. 30 and include revisions not distributed to the months.
 2. Average for the year.
 3. Daily average.
 4. Beginning Jan. 1981, data are for top-rated only. Prior data cover a range of top-rated and regional dealer closing rates. See also note 3 for this page.
 5. Beginning Oct. 1981, data represent the total surplus or deficit (budget surplus or deficit plus off-budget surplus or deficit). See also note 1.
 6. Interest rate charged as of Dec. 1, 1982 was 12.14.
- # Includes data for items not shown separately.
- § The Department of Health, Education, and Welfare was redesignated as the Department of Health and Human Services by the Department of Education Organization Act.
- ¶ Adjusted to exclude domestic commercial interbank loans and Federal funds sold to domestic commercial banks.
- ‡ Rates on the commercial paper placed for firms whose bond rating is Aa or the equivalent. Data through Oct. 1979 show a maturity for 120-179 days. Beginning Nov. 1979, maturity is for 180 days.
- @ Data through Oct. 1979 show a maturity for 150-179 days. Beginning Nov. 1979, maturity is for 180 days.
- ‡‡ Courtesy of *Metals Week*.
- @@ Average effective rate

Page S-15

1. M1-A has been discontinued. M1-B will now be designated "M1."
- † Effective Feb. 1982 SURVEY, the money stock measures and components have been revised back to 1959. The Federal Reserve has redefined the monetary aggregates. The redefinition was prompted by the emergence in recent years of new monetary assets—for example, negotiable order of withdrawal (NOW) accounts and money market mutual fund shares—and alterations in the basic character of established monetary assets—for example, the growing similarity of and substitution between the deposits of thrift institutions and those of commercial banks. Monthly data from 1959 to date are available from the Banking Section of the Division of Research and Statistics at the Federal Reserve Board, Washington, D.C. 20551.
- ‡ Composition of the money stock measures is as follows:
- M1.—This measure is currency plus demand deposits at commercial banks and interest-earning checkable deposits at all depository institutions—namely NOW accounts, automatic transfer from savings (ATS) accounts, and credit union share draft balances—as well as a small amount of demand deposits at thrift institutions that cannot, using present data sources, be separated from interest-earning checkable deposits.
- M2.—This measure adds to M1 overnight repurchase agreements (RP's) issued by commercial banks and certain overnight Eurodollars (those issued by Caribbean branches of member banks) held by U.S. nonbank residents, money market mutual fund shares, and savings and small-denomination time deposits (those issued in denominations of less than \$100,000) at all depository institutions. Depository institutions are commercial banks (including U.S. agencies and branches of foreign banks, Edge Act corporations, and foreign investment companies), mutual savings banks, savings and loan associations, and credit unions.
- M3.—This measure equals M2 plus large-denomination time deposits (those issued in denominations of \$100,000 or more) at all depository institutions (including negotiable CD's) plus term RP's issued by commercial banks and savings and loan associations.
- L.—This broad measure of liquid assets equals M3 plus other liquid assets consisting of other Eurodollar holdings of U.S. nonbank residents, bankers acceptances, commercial paper, savings bonds, and marketable liquid Treasury obligations.
- ‡‡ Includes ATS and NOW balances at all institutions, credit union share draft balances, and demand deposits at mutual savings banks.
- * Overnight (and continuing contract) RP's are those issued by commercial banks to the nonbank public, and overnight Eurodollars are those issued by Caribbean branches of member banks to U.S. nonbank customers.
- @ Small time deposits are those issued in amounts of less than \$100,000. Large time deposits are those issued in amounts of \$100,000 or more and are net of the holdings of domestic banks, thrift institutions, the U.S. Government, money market mutual funds, and foreign banks and official institutions.
- # Includes data for items not shown separately.
- § Number of issues represents number currently used; the change in number does not affect the continuity of the series.

Page S-16

1. Beginning Jan. 1981 data, U.S. Virgin Islands trade with foreign countries is included.
- § Number of issues represents number currently used; the change in number does not affect the continuity of the series.
- ‡ For bonds due or callable in 10 years or more.
- # Includes data for items not shown separately.
- @ Data may not equal the sum of the geographic regions, or commodity groups and principal commodities, because of revisions to the totals not reflected in the component items.

Page S-17

1. See note 1 for p. S-16.
 2. Beginning Jan. 1982 data, the Customs value is being substituted for the f.a.s. value.
- # Includes data not shown separately.
- § Data may not equal the sum of geographic regions, or commodity groups and principal commodities, because of revisions to the totals not reflected in the components.

Page S-18

1. See note 1 for p. S-16.
 2. Annual total; quarterly or monthly revisions are not available.
 3. Before extraordinary and prior period items.
 4. For month shown.
 5. Domestic trunk operations only (averaging about 90 percent of domestic total).
 6. See note 2 for p. S-17.
- # Includes data for items not shown separately.
- § Total revenues, expenses, and income for all groups of carriers also reflect nonscheduled service.
- ‡ Beginning Jan. 1977, defined as those having operating revenues of \$50 million or more.
- ¶ Average daily rent per room occupied, not scheduled rates.
- @ Effective January 1, 1980, contract carriers are not included because the data filed by these carriers were substantially reduced in scope, in accordance with the ICC revised reporting regulations.

Page S-19

1. Reported annual total; monthly revisions are not available.
 2. Data withheld to avoid disclosing operations of individual companies.
 3. Beginning Jan. 1981, data represent gross weight (formerly phosphoric acid content weight) and are not comparable with data shown for earlier periods.
 4. A portion of data is being withheld to avoid disclosing information for individual companies; not comparable with other published data.
 5. Beginning Jan. 1980 data, another company is included.
 6. A portion of data is being suppressed because of not meeting publication standards.
- For nitrogen solutions, see also note 4 for this page.
7. Less than 500 short tons.
- # Includes data for items not shown separately.
- § Data are reported on the basis of 100 percent content of the specified material unless otherwise indicated.
- ‡ Revisions, back to 1977 for some commodities, are available upon request.
- ¶ Data for Jan. 1977-June 1979 exclude potassium magnesium sulfate; not strictly comparable with data shown for other periods.

Page S-20

1. Reported annual total; monthly revisions are not available.
 2. Annual total includes Hawaii; not distributed to the months.
 3. Beginning 1982, the reporting frequency has been changed from a monthly to a quarterly basis. Revised quarterly data for 1979 through 1981 are available upon request.
 4. Reported annual total, including Hawaii; monthly data are preliminary and subject to change.
- § Data are not wholly comparable from year to year because of changes from one classification to another.
- ‡ Revisions back to 1977 are available upon request.

3. Effective Jan. 1981, data are revised back to Jan. 1980. Inventory data formerly calculated by the Bureau of the Census are now based on the Steel Service Center Institute monthly Business Conditions report.

Page S-26

1. Annual data; monthly revisions are not available.
 2. Less than 50 tons.
- ¶ Includes secondary smelters' lead stocks in refinery shapes and in copper-base scrap.
 @ All data (except annual production figures) reflect GSA remelted zinc and zinc purchased for direct shipment.
 ‡ Source for monthly data: American Bureau of Metal Statistics. Source for annual data: Bureau of Mines.
 # Includes data not shown separately.
 † Effective July 1980 SURVEY data are revised and shown on a new base. The sample size has been restored to 100 firms and the base has been changed to 1977=100. The revised series are not comparable to previously published data.
 * New series. These indexes are based on shipments of hydraulic and pneumatic products reported by participating members of the National Fluid Power Association. Data back to 1959 are available upon request.

Page S-27

1. Effective Jan. 1980, total stocks for bituminous coal and lignite exclude residential and commercial stocks and are not comparable with data shown for earlier periods.
 2. Data are for five weeks; other months 4 weeks.
 3. Based on new 1981 stock level. See also note "‡" for this page.
 4. For month shown.
- # Includes data for items not shown separately.
 @ Beginning July 1977, data are representative of those manufacturers reporting and are not an average of the total industry; they are not directly comparable with earlier data.
 * New series. Annual data prior to 1978 and monthly data prior to April 1979 are available upon request.
 § Includes nonmarketable catalyst coke.
 ¶ Includes small amounts of "other hydrocarbons and alcohol new supply (field production)," not shown separately.
 † Revisions for 1978 are available upon request.
 ‡ Effective with 1981 petroleum data, the Energy Information Agency has changed some definitions and concepts to reflect recent developments in refining and blending practices. These changes include adding a category for gasohol production to motor gasoline production and accounting more precisely for distillate and residual fuel oil processed further after initial distillation. A description of these changes appears in the May 1981 issue of *Monthly Energy Review*, U.S. Department of Energy, Energy Information Administration.

Page S-28

1. Based on new 1981 stock level. See also note "‡" for p. S-27.
 2. See note 5 for p. S-29.
 3. Reported annual totals; revisions not allocated to the months.
 4. Simple averages of prices are no longer available.
- ¶ Prices are mid-month, include taxes, and represent full service; comparable prices prior to Jan. 1979 are not available.
 # Includes data for items not shown separately.
 * New series. See note "¶" for this page.
 ‡ Except for price data, see note "‡" for p. S-27.

Page S-29

1. Reported annual total; revisions not distributed to the months.
 2. Effective Jan. 1980, data are no longer available.
 3. Average for 11 months; no price for Aug. 1980 or June 1981.
 4. Average for 11 months; no price available for Nov. 1980 or for Oct. 1981.
 5. Monthly data will be discontinued as of April 1982 SURVEY, due to budgetary limitations. The related annual report, MA26A, will continue to be published.
- ¶ Source: American Paper Institute. Total U.S. estimated consumption by all newspaper users.
 § Monthly data are averages of the 4-week periods ending on the Saturday nearest the end of the month; annual data are as of Dec. 31.
 ‡ Data are monthly or annual totals. Formerly weekly averages were shown.

Page S-30

1. Reported annual total; revisions not allocated to the months.
 2. Crop for the year.
 3. Data cover five weeks; other months, four weeks.
 4. Data are not available prior to Jan. 1980.
 5. See note "‡" for this page.
 6. Data for regular basecoat plasters not available; sales of "all other" represents total sales of building plasters.
 7. Data withheld to avoid disclosing operations of individual companies.
- * New series. Data for finishing mills have replaced data for weaving mills, which are no longer available.
 # Includes data for items not shown separately.
 ¶ Cumulative ginnings to the end of month indicated.
 § Bales of 480 lbs.
 ‡ Beginning Jan. 1982, shipments include those for direct export; such shipments for 1980-81 were (thous. gross): 2,316 and 2,165 respectively.
 @ Annual totals are based on advance summaries and reflect revisions not distributed to the months.

Page S-31

1. Effective Jan. 1, 1978, includes reexports, formerly excluded.
2. Annual total includes revisions not distributed to the months.
3. Average for crop year; Aug. 1-Jul. 31.
4. For five weeks; other months four weeks.
5. Monthly average.
6. Less than 500 bales.
- § Bales of 480 lbs.
- ¶ Based on 480-lb. bales, preliminary price reflects sales as of the 15th; revised price reflects total quantity purchased and dollars paid for the entire month (revised price includes discounts and premiums).
- # Includes data not shown separately.

Page S-32

1. Annual total includes revisions not distributed to the months.
 2. Estimates of production, not factory sales.
 3. Beginning Jan. 1979, data reflect the inclusion of Volkswagens produced in the U. S. Beginning Jan. 1980, passenger vans (previously reported as passenger cars) are included with trucks.
 4. Monthly data for 1980 as published in earlier issues of the SURVEY, exclude exports for off-highway trucks; not strictly comparable with data shown for other periods. Such exports have since been included in the monthly data and are available upon request.
 5. Based on unadjusted data.
 6. See note "†" for this page.
 7. Effective with the September 1982 SURVEY, retail sales of trucks have been restated back to Jan. 1982 to include U.S.-built Mercedes-Benz trucks (19,501 - 33,000 lbs.); comparable stock data, prior to Aug. 1982, are not available.
 8. See last sentence of note 4 for this page.
- # Total includes backlog for nonrelated products and services and basic research.
 § Domestics comprise all cars assembled in the U.S. and cars assembled in Canada and imported to the U.S. under the provisions of the Automotive Products Trade Act of 1965. Imports comprise all other cars.
 ¶ Courtesy of R.L. Polk & Co.; republication prohibited. Because data for some states are not available, month-to-month comparisons are not strictly valid.
 ‡ Excludes railroad-owned private refrigerator cars and private line cars.
 † Revisions, back to 1967 for some commodities, are available upon request. Effective with the July 1982 SURVEY, seasonally adjusted data for passenger cars have been revised back to Jan. 1977 and are available upon request.
 @ In the 1979 BUSINESS STATISTICS, 4th Qtr. 1977 should read "13,946" mil. \$.
 ‡ In the 1979 BUSINESS STATISTICS, annual data for 1977 should read "2,604.8" mil. \$.
 ## Revisions back to 1977 are available upon request.

FIXED REPRODUCIBLE TANGIBLE WEALTH IN THE UNITED STATES, 1925-79

U.S. DEPARTMENT OF COMMERCE
Bureau of Economic Analysis

Fixed Reproducible Tangible Wealth in the United States, 1925-79 provides estimates of capital stocks and related measures for:

- Fixed nonresidential private capital
- Residential capital
- Government-owned fixed capital
- Durable goods owned by consumers

The methodology and the investment series used to derive the wealth estimates are also presented. The estimates are consistent with the NIPA's, definitionally and statistically. This book is available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. (Stock number 003-010-00102-0, price \$13.00). To order call (202) 783-3238 or use the order blank.
