- iv. Taking Account

Articles

1. GDP and the Economy: Advance Estimates for the Third Quarter of 2012

Real GDP growth picked up, rising 2.0 percent after rising 1.3 percent in the second quarter. Consumer spending on goods accelerated. Federal government spending turned up, reflecting an upturn in national defense spending.

6. Newly Available NIPA Tables

Two new tables are available: (1) personal income and its disposition by households and nonprofits and (2) BEA income and outlays of nonprofits compared with IRS revenue and expense data.

8. Updated Summary of NIPA Methodologies

The data and methods used to prepare current-dollar and real estimates of GDP as well as current-dollar estimates of gross domestic income, reflecting the 2012 annual NIPA revision.

27. BEA Briefing: Territorial Economic Accounts for American Samoa, the Commonwealth of the Northern Mariana Islands, Guam, and the U.S. Virgin Islands

Updated estimates of GDP and expanded accounts that include estimates of GDP by industry and compensation by industry and more detailed estimates of consumer spending for 2002–2010.

44. Research Spotlight: A Prototype BEA/BLS Industry-Level Production Account for the United States

BEA and BLS have integrated GDP by industry statistics with productivity statistics, providing new details on industry sources of aggregate economic growth.

51. U.S. Multinational Companies: Operations of U.S. Parents and Their Foreign Affiliates in 2010

The value added of U.S. multinational companies increased 10.3 percent. The value added of U.S. parents increased 11.2 percent, and the value added of their foreign affiliates increased 8.4 percent. Worldwide employment of U.S. multinational companies increased 0.5 percent.

76. An Analysis of Revisions to BEA's International Economic Accounts

A study of revisions to the first published estimates of the quarterly international transactions accounts for 1999–2011 shows that the accounts provide an accurate picture of economic activity between U.S. residents and foreigners.

103. Schedule of BEA News Releases in 2013

Upcoming in the Survey...

A Preview of the Upcoming 2013 Comprehensive NIPA Revision. Improved methods for measuring the output of commercial banks and other financial intermediaries.

Annual Industry Accounts. Revised statistics for 2009–2011.

Annual Revision of Local Area Personal Income. New statistics for 2011 and revised statistics for 2009–2010.

November 2012 iii

Director's Message

To provide a better understanding of the sources of economic growth, the Bureau of Economic Analysis (BEA) and the Bureau of Labor Statistics have been collaborating to create integrated production accounts that combine productivity statistics and gross domestic product (GDP) statistics. In 2009, the agencies began producing annual integrated production accounts for the nonfarm business sector. In this issue, a *Research Spotlight* discusses a new milestone: prototype estimates that integrate productivity statistics and GDP by industry statistics, which provides new details on industry sources of aggregate economic growth.

We are pleased to present a study that examines the accuracy of our international economics accounts, focusing particularly on the widely used international transactions accounts (ITAs). Based on the analysis of revisions to quarterly estimates for 1999–2011, we conclude that the ITA estimates provide a consistent and accurate picture of economic activity between U.S. residents and foreigners. Early estimates closely track later estimates. Revisions tend to be relatively small. And revisions rarely change the direction of movement in the accounts.

Another article details the operations of U.S. multinational companies for 2010, offering a look at changes in value added, employment, goods exports and imports, and research and development activity.

A *BEA Briefing* presents economic statistics for 2002–2010 for American Samoa, the Commonwealth of the Northern Mariana Islands, Guam, and the U.S. Virgin Islands, including GDP, GDP by industry, and compensation by industry. They are produced in collaboration with the Department of the Interior's Office of Insular Affairs and with staff from the territorial governments.

In addition, we present our annual guide to the methodologies and source data for the national income and product accounts, a valuable resource for all users of the statistics. The advance estimates for the third quarter of 2012 are also presented.

J. Steven Landefeld

Taking Account...

BEA economists discuss revisions at IARIW event

At the 32nd general conference of the International Association for Research in Income and Wealth (IARIW) in August, Bureau of Economic Analysis (BEA) economists Brent R. Moulton and Dennis J. Fixler discussed revisions to gross domestic product (GDP) statistics, with a closer look at revisions for the most recent recession.

The presentation explained that revisions are part of the regular estimation process—not the result of errors. The process aims to improve the initial GDP estimates by incorporating more accurate source data.

When BEA calculates the advance estimate of GDP, it doesn't yet have complete source data. Thus, BEA has to make trendbased projections for the missing data. As new and more complete data become available, that information is incorporated into the second and third GDP estimates in subsequent months.

About 45 percent of the components in the advance estimate are based on initial or early estimates from various monthly and quarterly surveys that are subject to revision later for various reasons, including late respondents that are eventually incorporated into the survey results. Another roughly 14 percent of the components of the advance estimate is based on historical trends.

For the second GDP estimate, new data for the third month and revised data for earlier months are incorporated. For the third estimate, even more data are available; only 17 percent of the GDP estimate is based on data from the first set of monthly and quarterly surveys. Subsequent annual revisions and benchmark revisions allow for even more accurate data to be incorporated.

The manufacturing output estimation process demonstrates how the revisions process incorporates more accurate data. For its earliest GDP estimates, BEA relies on the Census Bureau's monthly M3 report, which features voluntary reporting, 4,300 reporting units with more than \$500 million in shipments (representing 60 percent of manufacturing) in 89 industries, with no product detail. But for annual revisions, BEA relies on the Census Bureau's more accurate Annual Survey of Manufactures, which features mandatory reporting, 50,000 reporting units (representing all 328,500 manufacturing establishments) in 471 industries, with 1,384 product classes.

BEA studies show the earliest quarterly GDP estimates successfully indicated the following:

- The direction of change in GDP 97 percent of the time
- The acceleration or deceleration of growth 72 percent of the time
- •The relative magnitude of growth—whether it was above, near, or below trend more than 80 percent of the time

- The cyclical peaks before 5 of the 6 recessions between 1969 and 2006
- The cyclical troughs of 4 of the 6 recessions
- Revisions in both currentdollar and real GDP and their major components are roughly similar to each over 1983–2009

The presentation also discussed GDP revisions for the recession that began in late 2007 and ended in the summer of 2009. For this period, the revisions were larger than usual, and the earliest estimates understated the extent of the decline, exposing gaps in the source data used for early estimates. Via the normal revisions process, actual data replaced assumptions, and source data were updated. For the fourth quarter of 2008, for example, the GDP growth was revised from -3.8 percent in January of 2009 to –6.2 percent the next month. Via annual revisions, the estimate for the quarter was revised to -8.9 percent in July 2011. The total revision from advance to latest (5.1 percentage points) is the largest downward GDP revision on record at BEA.

From the first estimate of the full contraction period (2007:IV to 2009:II) to the estimate, the cumulative contraction in real GDP was revised from -3.7 percent to -4.7 percent.

Presentations for the conference, which was hosted by BEA in Boston, can be viewed at www.iariw2012.com.

November 2012

GDP and the Economy

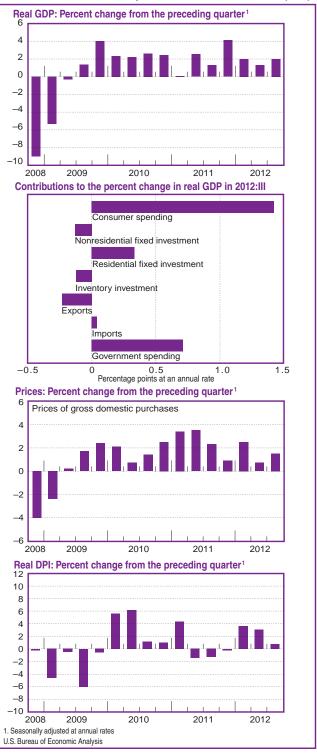

Advance Estimates for the Third Quarter of 2012

REAL GROSS domestic product (GDP) increased 2.0 percent at an annual rate in the third quarter of 2012 after increasing 1.3 percent in the second quarter, according to the advance estimates of the national income and product accounts (NIPAs) (chart 1 and table 1).¹

The acceleration in real GDP in the third quarter primarily reflected an upturn in federal government spending, a downturn in imports, an acceleration in consumer spending, a smaller decrease in inventory investment, an acceleration in residential fixed investment, and a smaller decrease in state and local government spending that were partly offset by downturns in exports and in nonresidential fixed investment.²

- Prices of goods and services purchased by U.S. residents increased 1.5 percent in the third quarter after increasing 0.7 percent in the second quarter. Energy prices turned up in the third quarter, and food prices turned down. Excluding food and energy, gross domestic purchases prices increased 1.3 percent after increasing 1.4 percent.
- Real disposable personal income (DPI) increased 0.8 percent in the third quarter after increasing 3.1 percent in the second quarter. Current-dollar DPI increased 2.6 percent after increasing 3.8 percent. The sharper deceleration in real DPI than in current-dollar DPI reflected an acceleration in the PCE implicit price deflator, which is used to deflate DPI. The deflator increased 1.8 percent in the third quarter after increasing 0.7 percent. In current dollars, the deceleration in third-quarter DPI reflected a deceleration in personal income that was partly offset by a deceleration in personal current taxes.
- The personal saving rate, personal saving as a percentage of current-dollar DPI, was 3.7 percent in the third quarter; in the second quarter, the rate was 4.0 percent.

Chart 1. GDP, Prices, Disposable Personal Income (DPI)

^{1. &}quot;Real" estimates are in chained (2005) dollars, and price indexes are chain-type measures. Each GDP estimate for a quarter (advance, second, and third) incorporates increasingly comprehensive and improved source data; for more information, see "Revisions to GDP, GDI, and Their Major Components" in the July 2011 Survey of Current Business. Quarterly estimates are expressed at seasonally adjusted annual rates, which assumes that a rate of activity for a quarter is maintained for a year.

^{2.} In this article, "consumer spending" refers to "personal consumption expenditures (PCE)," "inventory investment" refers to "change in private inventories," and "government spending" refers to "government consumption expenditures and gross investment."

 Nore. Percent changes are from NIPA table 1.1.1, contributions are from NIPA table 1.1.2, and shares are from NIPA table 1.1.10.

Effects of the Summer Drought

This summer's drought adversely affected agricultural production in several Midwestern states. The NIPAs reflect the effects of the drought in several ways on the expenditure side of GDP and on the income side.

The farm inventory investment estimates reflect the continuing effects of the drought on farm production (particularly losses for corn and soybeans). Based on USDA farm statistics, BEA estimated that for the third quarter, the drought reduced farm inventory investment by \$29 billion (current dollars) and subtracted 0.42 percentage point from real GDP growth after reducing farm inventory investment by about \$12 billion for the second quarter and subtracting 0.17 percentage point from the growth in real GDP.

For the third quarter, crop insurance benefits received by farmers offset about \$15 billion of the crop losses related to the drought; in the second quarter, insurance benefits offset about \$6 billion of the losses.

For more details, see "Effects of the 2012 Midwest Drought on the NIPA Estimates" in the October 2012 Survey OF CURRENT BUSINESS.

Consumer spending accelerated in the third quarter, reflecting an upturn in durable goods and a pickup in nondurable goods that were partly offset by a slow-down in services. The upturn in durable goods primarily reflected upturns in motor vehicles and parts and in furnishings and household equipment. The pickup in nondurable goods was led by an upturn in clothing and footwear and a pickup in "other" nondurable goods that were partly offset by a slowdown in gasoline and other energy goods. The slowdown in services mainly reflected a slowdown in housing and utilities.

Nonresidential fixed investment turned down, reflecting a slowdown in equipment and software and a downturn in structures. Transportation equipment, especially aircraft, turned down, and industrial equipment slowed. Both manufacturing structures and commercial and health care structures turned down, but the downturns were partly offset by an upturn in mining exploration, shafts, and wells.

Residential fixed investment accelerated, reflecting a pickup in single-family structures and an upturn in "other" structures.

Inventory investment decreased less than in the second quarter. An upturn in nonfarm inventory investment was partly offset by a larger decrease in farm inventory investment that reflected the effects of the drought on crop production in the Midwest.

Exports turned down. The downturn primarily reflected a downturn in exports of goods that was mainly due to downturns in industrial supplies and materials, in nonautomotive consumer goods and in automotive vehicles, engines, and parts. In contrast, nonautomotive capital goods turned up, mainly reflecting an upturn in civilian aircraft, engines, and parts.

Imports turned down. The downturn primarily reflected a downturn in imports of goods that was mainly due to downturns in nonautomotive capital goods and in nonautomotive consumer goods. Imports of services picked up, mainly reflecting a pickup in royalties and license fees resulting from increased broadcasting fees for the Olympic events.

Federal government spending turned up, primarily reflecting an upturn in national defense spending, mainly consumption expenditures.

State and local government spending decreased less than in the second quarter.

Prices

Personal consumption expenditures (PCE): Food and beverages for off-premises									
consumption	3.3	1.3	0.7	0.6					
Energy goods and services	-5.0	8.1	-13.6	10.6					,
Excluding food and energy	1.3	2.2	1.7	1.3					/
Gross domestic product (GDP)	0.4	2.0	1.6	2.8					_
Exports	-3.8	2.8	0.5	0.2					
Imports	0.0	5.6	-3.9	-6.6					

The estimates under the contribution columns are also percent changes.
 Nors. Most percent changes are from NIPA table 1.6.7; percent changes for PCE for food and energy goods and services and for PCE excluding food and energy are calculated from index numbers in NIPA table 2.3.4. Contributions are from NIPA table 1.6.8. GDP, export, and import prices are from NIPA table 1.1.7.

Prices paid by U.S. residents, as measured by the gross domestic purchases price index, accelerated in the third quarter. Excluding food and energy, prices slowed very slightly.

Consumer prices picked up. The pickup was more than accounted for by an upturn in prices paid for gasoline and other energy goods. Prices paid for consumer services slowed somewhat, mainly reflecting a deceleration in prices paid for food services and accommodations.

Prices paid for nonresidential fixed investment slowed, mainly reflecting a slowdown in prices paid for structures.

Prices paid for residential fixed investment accelerated, increasing 2.6 percent after increasing 1.2 percent. The third-quarter increase was the largest since the fourth quarter of 2009.

Prices paid by government picked up. A pickup in prices paid by state and local governments, mainly for petroleum related goods, was partly offset by a slow-down in prices paid by the federal government.

Consumer prices excluding food and energy, a measure of the "core" rate of inflation, slowed somewhat, increasing 1.3 percent after increasing 1.7 percent.

The GDP price index increased 2.8 percent, 1.3 percentage points more than the increase in the price index for gross domestic purchases, reflecting a small increase in export prices (0.2 percent) relative to a larger decrease in import prices (6.6 percent).

Note on Prices

BEA's gross domestic purchases price index is the most comprehensive index of prices paid by U.S. residents for all goods and services. It is derived from the prices of personal consumption expenditures (PCE), private investment, and government consumption expenditures and gross investment.

BEA also produces price indexes for all the components of GDP. The PCE price index is a measure of the total cost of consumer goods and services, including durable goods, nondurable goods, and services. PCE prices for food, energy goods and services, and for all items except food and energy are also estimated and reported.

Because prices for food and energy can be volatile, the

price measure that excludes food and energy is often used as a measure of underlying, or "core," inflation. The core PCE price index includes purchased meals and beverages, such as restaurant meals, and pet food. (See the FAQ "What is the core PCE price index and why has it been redefined?" on BEA's Web site.)

BEA also prepares a supplemental PCE price index, the "market-based" PCE price index, that is based on market transactions for which there are corresponding price measures. This index excludes many imputed expenditures, such as financial services furnished without payment, that are included in PCE and the PCE price index. BEA also prepares a market-based measure that excludes food and energy.

Saving

Personal saving—disposable personal income less personal outlays—was \$445.0 billion in the third quarter, a decrease of \$35.3 billion that followed a second-quarter increase of \$52.6 billion. The downturn in third-quarter personal saving reflected a deceleration in personal income and an acceleration in personal outlays.

Personal income, which is measured in current dollars, decelerated in the third quarter, increasing \$89.3 billion after increasing \$130.3 billion. The deceleration primarily reflected a sharp downturn in personal interest income and decelerations in wage and salary disbursements and in personal dividend income that were partly offset by an acceleration in farm proprietors' income.

The deceleration in wages and salaries reflected the pattern of monthly employment, hours, and earnings data from the Bureau of Labor Statistics for the third quarter.

The acceleration in farm proprietors' income primarilv reflected an acceleration in the expected indemnity payments to farmers for crop losses associated with the drought in the Midwest, based on U.S. Department of Agriculture data. (many farmers participate in crop insurance programs; federal government funding of this insurance is recorded as a current transfer payment to the farm sector from the federal government. Crop insurance benefits affect farm proprietors' income, but they do not directly affect either GDP or gross domestic income.

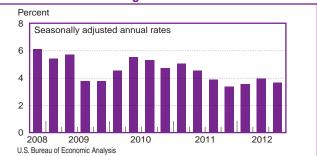

The downturn in personal interest income primarily reflected a downturn in interest rates.

The deceleration in personal dividend income reflected estimates based on data from corporate financial reports.

Government social benefits accelerated slightly. A deceleration in Medicaid payments was largely offset by an acceleration in Medicare payments (mainly for prescription drug benefits); the estimates were based on the incorporation of data from the Monthly Treasury Statement and data from the Centers for Medicare and Medicaid Services.

Personal current taxes decelerated, primarily reflecting a deceleration in state and local government income taxes.

Source Data and Key Assumptions for the Advance Estimates of GDP

The advance estimates of many components of GDP are based on 3 months of source data, but the estimates of some components are based on only 2 months of data. For the following items, the number of months for which data are available is shown in parentheses.

Personal consumption expenditures: sales of retail stores (3), unit auto and truck sales (3), and consumers' shares of auto and truck sales (2) retail gasoline sales (2), and electricity and gas usage and unit-value data (2) from the Energy Information Administration;

Nonresidential fixed investment: unit auto and truck sales (3), construction spending (value put in place) (2), manufacturers' shipments of machinery and equipment (3), and exports and imports of machinery and equipment (2);

Residential fixed investment: construction spending (value put in place) (2), single-family housing starts (3), sales of new homes (3), and sales of existing houses (3);

Change in private inventories: trade and nondurablegoods manufacturing inventories (2), durable-goods manufacturing inventories (3), and unit auto and truck inventories (3); farm inventories from the U.S. Department of Agriculture (3);

Net exports of goods and services: exports and imports of • An increase in state and local government structures. goods and services (2);

Government consumption expenditures and gross investment: federal outlays (3), state and local government construction spending (value put in place) (2), and state and local government employment (3);

Compensation: employment, average hourly earnings, and average weekly hours (3); and

Prices: consumer price indexes (3), producer price indexes (3), and values and quantities of petroleum import (2).

Unavailable source data

When source data were unavailable, BEA made various assumptions for September, including the following (table

- An increase in nonresidential structures,
- Increases in both single-family and multifamily residential structures,
- A decrease in the change in inventories of nondurablegoods manufacturing industries and an increase in the change in nonmotor vehicle merchant wholesale and retail trade inventories,
- An increase in exports of goods excluding gold and a larger increase in imports of goods excluding gold, and
- A more comprehensive list is available on BEA's Web site.

^{2.} Nonmonetary gold is included in balance-of-payments exports and imports, but it is

6 November 2012

Newly Available NIPA Tables

This report concludes the publication of tables from the 2012 annual revision of the national income and product accounts (NIPAs) with the presentation of NIPA tables 2.9 and 7.20.

The August 2012 Survey of Current Business includes an article that summarizes the results of the annual revision followed by the presentation of most of the NIPA tables. It also includes historical estimates in "GDP and

Other Major NIPA Series, 1929–2012:II." A second group of tables was published in the September issue: NIPA tables 3.15.1–3.15.6, 3.16, 3.17, and 7.15. A third group of tables was published in the October issue: NIPA tables 3.18B and 3.19-3.23.

The NIPA tables from all of these reports are available as interactive tables on BEA's Web site at www.bea.gov by clicking on "Interactive Data."

^{1.} Consists of nonmortgage interest paid by households.
2. Includes benefits paid to members, specific assistance to individuals, and grants and allocations.
3. Excludes unrelated sales, secondary sales, and sales to business, government, and the rest of the world; includes membership dues and fees.
4. Includes individual contributions and bequests from households.
5. Gross output is net of unrelated sales, secondary sales, and sales to business, government, and the rest of the world; excludes own-account investment (construction and software).

^{6.} Consists of excise taxes paid by nonprofit institutions serving households.
7. Consists of rental income of nonprofit institutions (line 48), income receipts on assets (line 49), transfer receipts from government (line 53), and transfer receipts from business (line 54).
8. Includes grants and allocations made by nonprofit institutions that indirectly support households through the support of other nonprofit institutions, plus their payments to affiliates.
Note. Estimates in this table exclude nonprofit institutions serving business and government.

8 November 2012

Updated Summary of NIPA Methodologies

The Bureau of Economic Analysis (BEA) has recently improved its estimates of current-dollar gross domestic product (GDP), current-dollar gross domestic income (GDI), and real GDP as part of the 2012 annual revision of the national income and product accounts (NIPAs).¹ The sources of data and the methodologies that are now used to prepare the NIPA estimates are summarized in this report.²

Current-dollar estimates of GDP and GDI

The major components and subcomponents of GDP and GDI are listed in table 1. In column 1 of the table, the name of the component is shown along with the currentdollar estimate of that component for 2011. In column 2, information about the sources of data and the methods that are used to prepare the estimates for the comprehensive benchmark revisions and for the annual revisions in nonbenchmark years are also presented, and the major differences between the data and the methods used in the benchmark revisions and those used in the annual revisions are noted. For example, for "Furnishings and durable household equipment" in personal consumption expenditures (PCE) (the second item in table 1), the table indicates that one methodology (commodity flow) is used to prepare the estimates for benchmark years, and another methodology (retail control) is used to prepare the estimates for all the other years.

In column 3, information about the current quarterly estimates is also presented. For most components, information about the advance quarterly estimates, which are prepared about a month after the end of the quarter, are provided because more attention tends to be focused on this "first look" at GDP for a quarter. Major source data that become available for the "second" or "third" quarterly estimates for some NIPA components are also noted. Only the source data and methods are listed; the number of months of available source data and whether

or not the source data will be revised by the source agency are not included.³

Source data

The source data include a variety of economic measures, such as sales or receipts, wages and salaries, unit sales, housing stock, insurance premiums, expenses, interest rates, mortgage debt, and tax collections.

For most components, the estimates are derived from source data that are "value data": they encompass both the quantity data and the price data required to prepare the current-dollar estimates. For these components, the value data are adjusted to derive estimates that are consistent with NIPA definitions and coverage.

For the estimates that are not derived from value data, the sources of the quantity and price data that are used to prepare value estimates are indicated, and the major adjustments that are needed to derive estimates that are consistent with NIPA definitions and coverage are specified.

For the current-dollar estimates of GDP, a "physical quantity times price" method is used for several components. For example, the annual estimate of expenditures on new autos in a nonbenchmark year is calculated as unit sales times expenditure per auto (the average transactions price that reflects all discounts and customer rebates).

For the current-dollar estimates of GDI, two general methods are used for several components—an "employment times earnings times hours" method and variations of a "stock of assets/liabilities times an effective interest rate" method.

Some quarterly (or monthly) estimates are derived using source data as indicators to interpolate or extrapolate annual estimates. In other cases, extrapolation and interpolation may be based on trends; in those cases, the use of "judgmental trend" is indicated.

Estimation methods

BEA also uses four methods to estimate values: the commodity-flow method, the retail-control method, the perpetual-inventory method, and the fiscal year analysis method.

The commodity-flow method involves estimating values based on various measures of output. For example, the estimates of PCE for "Furnishings and durable household equipment" in benchmark years are based on data on manufacturers' shipments from the Census Bureau,

^{1.} The concepts and methodologies that underlie the NIPAs are subject to periodic improvements as part of the comprehensive and annual NIPA revisions, and these improvements are described in a series of articles in the Survey of Current Business; for a list of these articles, see appendix B at the back of this issue. See also Eugene P. Seskin and Alyssa E. Holdren, "Annual Revision of the National Income and Product Accounts," Survey 92 (August 2012): 6–31.

^{2.} For detailed descriptions of the fundamental concepts, definitions, classifications, and accounting framework that underlie the NIPAs and of the general sources and methods that are used to prepare the estimates, see the following in *Concepts and Methods of the U.S. National Income and Product Accounts:* "Introductory Chapters 1–4," "Chapter 5: Personal Consumption Expenditures," "Chapter 6: Private Fixed Investment," "Chapter 7: Change in Private Inventories," "Chapter 8: Net Export of Goods and Services, "Chapter 9: Government Consumption Expenditures and Gross Investment," "Chapter 10: Compensation of Employees," and "Chapter 13: Corporate Profits" on BEA's Web site at bea.gov/methodologies/index.htm.

^{3.} For specific information on key monthly source data incorporated in the current quarterly estimates, see "GDP and the Economy" in the Survey.

and BEA adjusts the data for imports and exports. In general, this method is used to derive estimates of various components of PCE, equipment and software investment, and of the commodity detail for state and local government consumption expenditures and gross investment.⁴ An abbreviated form of this method is used to prepare estimates of equipment and software investment in nonbenchmark years, and an even more abbreviated form is used to prepare the current quarterly estimates of equipment and software investment.

The retail-control method uses retail sales data, usually compiled by the Census Bureau, to estimate expenditures.⁵ It is used to prepare estimates of many subcomponents of PCE for durable and nondurable goods in nonbenchmark years. This method ensures that the growth rate for these subcomponents is the same rate as the "retail control" group, a measure based on the total sales of most kinds of businesses selling goods from the Census Bureau's monthly and annual retail trade surveys.

The perpetual-inventory method is used to derive estimates of fixed capital stock, which are used to estimate consumption of fixed capital—the economic charge for the using up of private and government fixed capital. This method is based on investment flows and a geometric depreciation formula.⁶

The fiscal year analysis method is used to estimate annual and quarterly estimates of consumption expenditures and gross investment by the federal government. The estimates of expenditures are calculated by program, that is, by activity for a single line item or for a group of line items in the *Budget of the U.S. Government*. For most programs, BEA adjusts budget outlays so that they conform to NIPA concepts and definitions and classifies the expenditures in the appropriate NIPA category—such as current transfer payments or interest payments—with nondefense consumption expenditures and gross investment determined residually. When a fiscal year analysis is completed, the detailed array of NIPA expenditures by program and by type of expenditure provides a set of control totals for the quarterly estimates.⁷

International transactions accounts

The source data for the foreign transactions that are reflected in most NIPA components—such as net exports of goods and services, net income receipts, and rest-of-the-world corporate profits—are from the international

transactions accounts (ITAs) that are prepared by BEA.⁸ As noted in table 1, for some NIPA components, the ITA estimates are adjusted to conform to NIPA concepts and definitions. For the annual estimates of these adjustments and their definitions, see NIPA table 4.3B in the August 2012 SURVEY (page 127).⁹

Reconciliation tables. In preparing the annual estimates of several components of GDI, BEA adjusts the source data to conform to NIPA concepts and coverage. For each subcomponent, an annual NIPA table reconciles the value published by the source agency with the NIPA value published by BEA, and the adjustments are listed. Reconciliation tables for the following subcomponents were published in "National Income and Product Accounts Tables" in the August 2012 Survey: consumption of fixed capital in table 7.13; nonfarm proprietors' income in table 7.14; corporate profits in table 7.16; net monetary interest in table 7.17; and wages and salaries in table 7.18.

Estimates of real GDP

BEA uses three methods to estimate real GDP: the deflation method, the quantity extrapolation method, and the direct valuation method. These methods and the source data that are used for estimation are listed in table 2.

The deflation method is used for most components of GDP. A quantity index is derived by dividing the current-dollar index by an appropriate price index that has the base year—currently 2005—equal to 100. The result is then multiplied by 100.

The quantity extrapolation method uses quantity indexes that are obtained by using a quantity indicator to extrapolate from the base-year value of 100.

The direct valuation method uses quantity indexes that are obtained by multiplying the base-year price by actual quantity data for the index period. The result is then expressed as an index with the base year equal to 100.

The subcomponents in table 2 are the same as those shown in table 1, but the detail differs to highlight the alternative methodologies that are used to calculate the real estimates.¹⁰

^{4.} For additional information on the commodity-flow method, see "Chapter 4: Estimating Methods" in *Concepts and Methods of the U.S. National Income and Product Accounts*, 4–8 and 4–9.

^{5.} For additional information, see "Estimating Methods," 4–9 and FAQ 519 "What is the retail-control method?" at faq.bea.gov.

^{6.} For additional information, see "Estimating Methods," 4-11.

^{7.} For details, see "Chapter 9: Government Consumption Expenditures and Gross Investment."

^{8.} See U.S. International Transactions Accounts: Concepts and Estimation Methods at www.bea.gov/international/concepts_estimation_methods.htm. Improvements in methodology are usually introduced as part of annual ITA revisions; see Jeffrey R. Bogen and Jessica M. Hanson, "Annual Revision of the U.S. International Transactions Accounts" Survey 92 (July 2012): 35_46

^{9.} Quarterly estimates are presented in NIPA underlying detail table $4.3\mathrm{BU}$.

^{10.} For the real estimates, the distinction between annual and quarterly methodologies is less important than it is for the current-dollar estimates. For the relatively few cases in which the annual and quarterly source data differ, the major differences are noted.

and other years or used to prepare an extrapolator or interpolator prepare an extrapolator	Component	Annual estimates: Source data and methods used to determine level for benchmark and other years or used to prepare an extrapolator or interpolator	Current quarterly estimates: Source data and methods used to prepare an extrapolator ¹
--	-----------	--	---

Gross domestic product of \$15,075.7 billion for 2011

Personal consumption expenditures (\$10,729.0 billion)

Goods (\$3,624.8 billion)

Durable goods (\$1,146.4 billion)

Motor vehicles and parts (\$373.6 billion)

Benchmark years. For new motor vehicles, physical quantity purchased times average retail price: unit sales, information to allocate sales among consumers and other purchasers, and average transactions prices that reflect all discounts and customer rebates, all from trade sources. For net transactions, residual based on net sales by other sectors. For dealers' margins, retail sales from Census Bureau quinquennial census and margin rates from Census Bureau annual survey of retail trade. For motor vehicle parts and accessories, commodity-flow method, starting with manufacturers' shipments from Census Bureau quinquennial census, including an adjustment for exports and imports from Census Bureau foreign trade data.

Other years except the most recent year. For new motor vehicles, same as the benchmark years. For net transactions, change in consumer stock of motor vehicles from trade sources. For dealers' margins, for franchised dealers, unit sales and sales prices from trade sources times margin rates for independent dealers from Census Bureau ARTS. For motor vehicle parts and accessories, retail-control method, using retail sales from Census Bureau ARTS.

Most recent year. For new motor vehicles and for net transactions, same as the annual estimates for other years. For dealers' margins, for franchised dealers, unit sales and sales prices from trade sources. For independent dealers, sales from Census Bureau monthly survey of retail trade. For motor vehicles parts and accessories, retail-control method, using retail sales from Census Bureau monthly survey of retail trade.

Benchmark years. Commodity-flow method, starting with manufacturers' shipments from Census Bureau quinquennial census, including an adjustment for exports and imports from Census Bureau foreign trade data.

Other years except the most recent year. Retail-control method, using retail sales from Census Bureau ARTS.

Most recent year. Retail-control method, using Census Bureau monthly survey of retail trade.

Recreational goods and vehicles (\$340.1 billion)

Bend ship adi

Furnishings and durable

(\$251.7 billion)

household equipment

Benchmark years. Commodity-flow method, starting with manufacturers' shipments from Census Bureau quinquennial census, including an adjustment for exports and imports from Census Bureau foreign trade data.

Most recent year. Retail-control method, using Census Bureau monthly survey of retail trade.

Benchmark years. Commodity-flow method, starting with manufacturers' shipments from Census Bureau quinquennial census, including an adjustment for exports and imports from Census Bureau foreign trade data.

Other years except the most recent year. Retail-control method, using retail sales from Census Bureau ARTS.

Most recent year. Retail-control method, using Census Bureau monthly survey of retail trade.

Nondurable goods (\$2,478.4 billion)

Food and beverages purchased for offpremises consumption (\$810.2 billion)

Other durable goods

(\$181.0 billion)

Benchmark years. Commodity-flow method, starting with manufacturers' shipments from Census Bureau quinquennial census, including an adjustment for exports and imports from Census Bureau foreign trade data. For food produced and consumed on farms, USDA data.

Other years except the most recent year. Retail-control method, using retail sales from Census Bureau ARTS. For food produced and consumed on farms, same as for benchmark years.

Most recent year. Retail-control method, using Ćensus Bureau monthly survey of retail trade. For food produced and consumed on farms, same as for benchmark years.

For new motor vehicles, same as the annual estimates for other years. For net transactions, extrapolated by retail sales of used vehicle dealers from Census Bureau monthly survey of retail trade. For dealers' margins, same as the annual estimates for the most recent year and judgmental trend. For motor vehicle parts and accessories, same as the annual estimates for the most recent year.

Same as the annual estimates for the most recent year.

Same as the annual estimates for the most recent year.

Same as the annual estimates for the most recent year.

For food produced and consumed on farms, judgmental trend. For all others, same as the annual estimates for the most recent year.

Table 1. Source Data and Methods for Current-Dollar GDP and Current-Dollar GDI—Continues

Component	Annual estimates: Source data and methods used to determine level for benchmark and other years or used to prepare an extrapolator or interpolator	Current quarterly estimates: Source data and methods used to prepare an extrapolator ¹
Clothing and footwear (\$349.2 billion)	Benchmark years. For standard clothing issued to military personnel, data from OMB's <i>Budget of the United States</i> . For all others, commodity-flow method, starting with manufacturers' shipments from Census Bureau quinquennial census, including an adjustment for exports and imports from Census Bureau foreign trade data. Other years except the most recent year. For standard clothing issued to military personnel, same as for benchmark years. For all others, retail-control method, using retail sales from Census Bureau ARTS. Most recent year. For standard clothing issued to military personnel, same as for benchmark years. For all others, retail-control method, using Census Bureau monthly survey of retail trade.	For standard clothing issued to military personnel, judgemental trend. For all others, same as the annual estimates for the most recent year.
Gasoline and other energy goods (\$428.3 billion)	Benchmark years. For motor vehicle fuels, lubricants, and fluids, physical quantity purchased times average retail price: gallons consumed from the Department of Transportation; information to allocate total gallons among consumers and other purchasers from federal agencies and trade sources; average retail price by grade from the Bureau of Labor Statistics (BLS). For fuel oil and other fuels, commodity-flow method, starting with manufacturers' shipments from Census Bureau quinquennial census, including an adjustment for exports and imports from Census Bureau foreign trade data. Other years except the most recent year. For motor vehicle fuels, lubricants, and fluids, quantity shipments from the Energy Information Administration (EIA) times average retail price from BLS. For fuel oil and other fuels, retail-control method, using Census Bureau ARTS. Most recent year. For motor vehicle fuels, lubricants, and fluids, same as other years For fuel oil and other fuels, retail-control method, using Census Bureau monthly survey of retail trade.	Same as the annual estimates for the most recent year.
Other nondurable goods (\$890.7 billion)	Benchmark years. For prescription drugs, Census Bureau quinquennial product-line data on retail sales for prescription drugs. For expenditures abroad by U.S. residents (net), BEA international transactions accounts. For all others, commodity-flow method, starting with manufacturers' shipments from Census Bureau quinquennial census, including an adjustment for exports and imports from Census Bureau foreign trade data. Other years except the most recent year. For prescription drugs, value of sales to consumers from a trade source. For tobacco, quantity shipped times consumer price: quantity shipments data from the U.S. Department of Treasury, Alcohol and Tobacco Tax and Trade Bureau times the CPI for tobacco and smoking products from BLS. For expenditures abroad by U.S. residents (net), same as for benchmark years. For all others, retail-control method, using retail sales from Census Bureau ARTS. Most recent year. For prescription drugs, for tobacco, and for expenditures abroad by U.S. residents (net), same as other years. For all others, retail-control method, using Census Bureau monthly survey of retail trade.	For expenditures abroad by U.S. residents (net), same as for benchmark years. For all others, same as the annual estimates for the most recent year.

monthly employment times earnings times hours and judgmental trend.

Component	Annual estimates: Source data and methods used to determine level for benchmark and other years or used to prepare an extrapolator or interpolator	Current quarterly estimates: Source data and methods used to prepare an extrapolator ¹					
Residential investment (\$3	338.7 billion) ²						
Permanent-site new single- family structures (\$108.2 billion)	Construction spending (value put in place) based on phased housing starts and average construction cost from Census Bureau monthly construction survey.	Same as the annual estimates.					
Permanent-site new multi- family structures (\$14.8 billion)	Construction spending (value put in place) from Census Bureau monthly construction survey.	Same as the annual estimates.					
Manufactured homes (\$3.4 billion)	Benchmark years. See the entry "Equipment except new autos, new light trucks, and net purchases of used autos and used light trucks" under "Nonresidential equipment and software." Other years. Physical quantity shipped times price: shipments from trade source and average retail price from Census Bureau monthly survey.	Same as the annual estimates for other years.					
Improvements (\$151.5 billion)	Benchmark years. Construction spending (value put in place) from Census Bureau construction survey. Others years. A weighted 3-year moving average of the improvements estimates from Census Bureau construction spending (value put in place) survey.	Retail sales of building materials and garden supply stores from Census Bureau monthly survey of retail trade and earnings data from BLS monthly current employment statistics.					
Brokers' commissions (\$53.4 billion)	Physical quantity of houses sold times mean sales price times BEA estimate of average commission rate: number of single-family houses sold and mean sales price from Census Bureau monthly construction survey and trade source.	Same as the annual estimates.					
Equipment (\$9.0 billion)	See the entry "Furnishings and durable household equipment" under "Personal consumption expenditures."	Same as the annual estimates.					
Change in private inventories (\$36.6 billion)							
Farm (-\$6.1 billion)	USDA change in inventories adjusted to exclude Commodity Credit Corporation (CCC) forfeitures and to include net CCC loans at market value.	For crops, BEA quarterly allocation of USDA annual projections of crop output and cash receipts. For livestock, USDA quarterly data.					
Manufacturing and trade (\$40.2 billion)	Benchmark years. Inventories from Census Bureau quinquennial census and annual surveys revalued to current replacement cost, with information on the proportions of inventories reported using different accounting methods, on the commodity composition of goods held in inventory, and on the turnover period, all from Census Bureau quinquennial census and annual surveys, combined with prices, largely based on BLS producer price indexes. (The difference between Census Bureau change in inventories and BEA change in private inventories is the inventory valuation adjustment.) Other years except the most recent year. For auto retail dealers, an average of quantities times average prices from trade sources and of retail inventories from Census Bureau annual surveys minus half of manufacturing and merchant wholesale inventories from Census annual surveys; for all others, inventories from Census Bureau annual surveys, revalued as described above. Most recent year. Inventories from Census Bureau monthly surveys and trade sources, revalued as described above.	Same as the annual estimates for the most recent year.					
Mining, utilities, construc- tion, and other nonfarm industries (\$2.6 billion)	Benchmark years. Mining and construction inventories from Census Bureau quinquennial census, publishing inventories from the Census Bureau service annual survey, revalued to current replacement cost as described above for "Manufacturing and trade." Other years except the most recent year. For publishing inventories, same as the annual estimates for benchmark years. For all others, IRS tabulations of business tax returns, revalued as described above. Most recent year. For mining and publishing inventories, Census Bureau quarterly financial report of corporations, revalued as described above. For electric utilities, monthly physical quantities from EIA combined with BLS producer price indexes. For all others, judgmental trend.	For mining and publishing inventories, advance estimates: judgmental trend; second and third estimates: same as the annual estimates for most recent year. For electric utilities, same as the annual estimate for the most recent year. For all others, judgmental trend.

Component	Annual estimates: Source data and methods used to determine level for benchmark and other years or used to prepare an extrapolator or interpolator	Current quarterly estimates: Source data and methods used to prepare an extrapolator ¹
Net exports of goods and	services (-\$568.1 billion)	
Exports and imports of goods, net (-\$754.7 billion)	Estimated as part of the international transactions accounts: export and import documents compiled monthly by the Census Bureau with adjustments by BEA for coverage and valuation to convert the data to a balance-of-payments basis. Balance-of-payments transactions adjusted for coverage of U.S. territories and Puerto Rico using data from the Commonwealth of Puerto Rico, the U.S. Virgin Islands, and the Census Bureau, and for coverage of gold transactions using data from the U.S. Geological Survey and trade sources.	For territorial adjustment, Census Bureau foreign trade data and judgmental trend. For gold, judgmental trend. For all others, same as the annual estimates.
Exports and imports of services, net (\$186.7 billion)	Estimated as part of the international transactions accounts: for government transactions, reports by federal agencies on their purchases and sales abroad. For most others in this group (including travel, passenger fares, other transportation, and royalties and license fees), BEA quarterly or annual surveys (supplemented with data from other sources). Transactions adjusted for the balance-of-payments coverage of U.S. territories and Puerto Rico (see the above entry), and to include financial services furnished without payment (see the entry "Banks, credit agencies, and investment companies" under "Net interest and miscellaneous payments").	For territorial adjustment, judgmental trend. For all others, same as the annual estimates.
Government consumption	n expenditures and gross investment (\$3,059.8 billion)	
Federal government (\$1,2)	22.1 billion)	
National defense except consumption of general government fixed capital (\$725.0 billion)	Within a control total established by fiscal year analysis: for compensation, military wages from OMB's <i>Budget of the United States</i> , civilian wages from BLS tabulations from the quarterly census of employment and wages (QCEW), civilian benefits from the Office of Personnel Management (OPM), and employer contributions for federal employee retirement plans from outlays from the <i>Monthly Treasury Statement</i> ; for other than compensation by type, based mainly on data from Department of Defense (DOD) reports; for software, see the entry under "Nonresidential equipment and software."	For components of compensation, military employment from DOD and civilian employment from BLS. For other than compensation, same as the annual estimates. For software, see the entry under "Nonresidential equipment and software."
National defense consumption of general government fixed capital (\$95.8 billion)	Perpetual-inventory method, based on gross investment estimates and on investment prices.	Same as the annual estimates.
Nondefense except consumption of general government fixed capital (\$367.1 billion)	Within a control total established by fiscal year analysis: for CCC inventory change, book values of acquisitions and physical quantities of dispositions from agency reports times average market prices from USDA; for compensation, civilian wages from BLS tabulations from the QCEW, civilian benefits from OPM, and employer contributions for federal employee retirement plans from outlays from the <i>Monthly Treasury Statement</i> ; for petroleum sales, distribution and price data from the Department of Energy; for research and development, obligations from the National Science Foundation and disbursements from the National Aeronautics and Space Administration; for construction, construction spending (value put in place) from Census Bureau monthly construction survey; for software, see the entry under "Nonresidential equipment and software;" for all others, outlays from the <i>Monthly Treasury Statement</i> . For financial services furnished without payment, see the entry "Banks, credit agencies, and investment companies" under "Net interest and miscellaneous payments."	For components of compensation, employment from BLS. For software, see the entry under "Nonresidential equipment and software." For all others and software, same as the annual estimates.
Nondefense consumption of general government fixed capital (\$34.2 billion)	Perpetual-inventory method, based on gross investment estimates and on investment prices.	Same as the annual estimates.

State and local governme	nt (\$1,837.7 billion)				
Consumption expenditures and gross investment except those items listed below (\$305.6 billion)	All years except the 3 most recent years. Total expenditures from Census Bureau census of governments and annual surveys of state and local governments, selectively replaced with source data that are more appropriate for the NIPAs and adjusted for coverage, for netting and grossing differences, to a calendar year basis from a fiscal year basis, for other timing differences, to exclude items not directly included in GDP (interest, subsidies, net expenditures of government enterprises, and transfer payments), and to exclude items described below. The 3 most recent years. Judgmental trend.	Judgmental trend.			
Compensation of general government employees (\$1,074.4 billion)	For wages and salaries, BLS tabulations from the QCEW. For employer contributions for government social insurance, tabulations from the Social Security Administration and other agencies administering social insurance programs. For employer contributions for employee pension and insurance funds, data from trade sources, CMS, Census Bureau annual surveys of state and local government retirement funds, adjusted to a calendar year basis from a fiscal year basis, Census Bureau annual surveys of state and local governments, adjusted to a calendar year basis from a fiscal year basis, and judgmental trend.	For wages and salaries, derived from BLS monthly employ-ment times earnings from BLS employment cost index. For other compensation, judgmental trend.			
Consumption of general government fixed capital (\$161.0 billion)	Perpetual-inventory method based on gross investment estimates and on investment prices.	Same as the annual estimates.			
Structures (\$256.3 billion)	Construction spending (value put in place) from Census Bureau monthly construction survey, benchmarked to quinquennial census of governments and annual surveys of state and local governments.	Construction spending (value put in place) from Census Bureau monthly construction surveys.			
Software (\$14.3 billion)	See the entry "Software" under "Nonresidential equipment and software."	Same as the annual estimates.			
Brokerage charges and financial services furnished without payment (\$26.1 billion)	See the entry "Financial services and insurance" under "Personal consumption expenditures."	Same as the annual estimates.			
Gross domestic income of \$15,043.8 billion for 2011					

Compensation of employees, paid (\$8,303.2 billion)

Wage and salar	y accruals ((\$6,669.3	billion)	١.
----------------	--------------	------------	----------	----

	(40,000.	
Wage and salary accruals (\$6,669.3 billion).	
Private industries (\$5,474.0 billion)	For most industries, BLS tabulations from the QCEW. For others, wages from a variety of sources (such as USDA for farms and the Railroad Retirement Board for railroad transportation), adjusted for understatement of income on tax returns and for coverage differences.	For most industries, wages and salaries derived from BLS monthly employment times earnings times hours. For others, judgmental trend.
Federal government (\$332.2 billion)	For civilians, wages from BLS tabulations from the QCEW adjusted for coverage differences; for military personnel, wages from OMB's <i>Budget of the United States</i> .	For civilians, employment from BLS and judgmental trend. For military personnel, DOD employment and judgmental trend.
State and local government (\$863.1 billion)	BLS tabulations from the QCEW adjusted for coverage differences.	Derived from BLS employment times earnings from BLS employment cost index.
Employer contributions for e	mployee pension and insurance funds (\$1,139.0 billion) ³	1
Group health insurance (\$591.4 billion)	All years except the most recent year. For private and for state and local government, employer contributions from CMS. Most recent year. For private, CMS tabulations. For state and local government, judgmental trend.	Judgmental trend.
Private pension and profit- sharing funds (\$254.3 billion)	All years except the 2 most recent years. Tabulations from Department of Labor. Two most recent years. Tabulations from Pension Benefit Guaranty Corporation and corporate financial data.	Judgmental trend.

BEA BRIEFING

Territorial Economic Accounts for American Samoa, the Commonwealth of the Northern Mariana Islands, Guam, and the U.S. Virgin Islands

New Estimates of GDP for 2010 and New Estimates of GDP by Industry, Compensation by Industry, and Detailed Consumer Spending for 2002–2010

By Aya Hamano

IN COLLABORATION with the Department of the Interior's Office of Insular Affairs (OIA) and with staff from the territorial governments, the Bureau of Economic Analysis (BEA) produces annual economic accounts for American Samoa, the Commonwealth of the Northern Mariana Islands (CNMI), Guam, and the U.S. Virgin Islands. The OIA provides funding for the work and facilitates interactions between BEA and the territorial governments.¹

The purpose of this ongoing project is to provide data users with a comprehensive, objective measure of economic activity for these four U.S. territories. Consistent measures of economic activity are critical for understanding the territorial economies and how they have developed over time. Without such measures, it is difficult for businesses and governments to make informed economic and financial planning decisions and for policymakers to assess the impact of their decisions on growth. For the United States, BEA produces gross domestic product (GDP) and other related economic measures as part of its national income and product accounts (NIPAs); however, these estimates cover only the 50 states and the District of Columbia. Transactions with the territories are classified as transactions with the "rest-of-the-world."

In previous years, BEA published estimates of GDP and its major components for these four territories.

This year, BEA released new estimates of GDP for 2010 and expanded the accounts to include annual GDP by industry statistics.² The estimates of GDP by industry provide additional information on economic growth and complement the GDP estimates that have been published in past releases. While the GDP estimates show how much the entire economy has grown (or contracted), the GDP by industry statistics show how major industries in each territory have contributed to that growth. Annual estimates of compensation by industry and more detailed estimates of consumer spending were also published for the first time. These additional statistics cover the period 2002–2010, the same period for which estimates of GDP have been published.

The estimates that were released this year show that the economies of all four territories grew in 2010. Real GDP for the United States (which excludes the territories) also grew in 2010. Highlights of the estimates for 2010 include the following:

• Government spending continued to play a large role in the economies of all four territories.³ In current dollars, government spending accounted for over 25

^{1.} OIA is the federal agency that manages the federal government's relations with the governments of American Samoa, the CNMI, Guam, and the U.S. Virgin Islands. It works with these territories to encourage economic development, transparency of government, financial stability, and accountability

^{2.} BEA released these estimates during separate visits to the four territories that took place between September and October of 2012. Individual news releases for each of the territories are available on BEA's Web site at www.bea.gov/national/gdp_territory.htm.

^{3.} In this article, "consumer spending" refers to "personal consumption expenditures," "inventory investment" refers to "change in private inventories," and "government spending" refers to "government consumption expenditures and gross investment." Private inventory investment for the CNMI and Guam is assumed to be negligible, so it is not shown in the tables.

Territorial Economic Accounts

percent of GDP in 2010 in each of the four territories. Government spending was particularly notable in Guam, where it accounted for over 60 percent of GDP; over half of this spending was by the federal government.

- The tourism industry continued to play a significant role in the economies of the CNMI, Guam, and the U.S. Virgin Islands; spending by tourists accounted for the majority of exports of services. In 2010, the tourism industry turned up in the CNMI and in Guam but continued to contract in the U.S. Virgin Islands.
- The private sector contributed positively to economic growth in American Samoa, the CNMI, and the U.S. Virgin Islands but contributed negatively to economic growth in Guam.
- Compensation of employees increased in Guam, the

CNMI, and the U.S. Virgin Islands, reflecting increases in compensation of workers in both the private and public sectors. In American Samoa, compensation of government employees increased, but private sector compensation fell significantly.

The estimates of GDP for each territory (including the new detailed estimates of consumer spending) are presented in further detail in this article and in the accompanying tables. Revised estimates of GDP for 2002–2009 are also shown; these estimates incorporated improved source data and methodologies. GDP by industry and compensation by industry are also presented separately for each territory; the industry detail shown varies depending on the territory.

The methods used to derive the estimates of GDP and GDP by industry are summarized in the appendix "Summary of Methodologies."

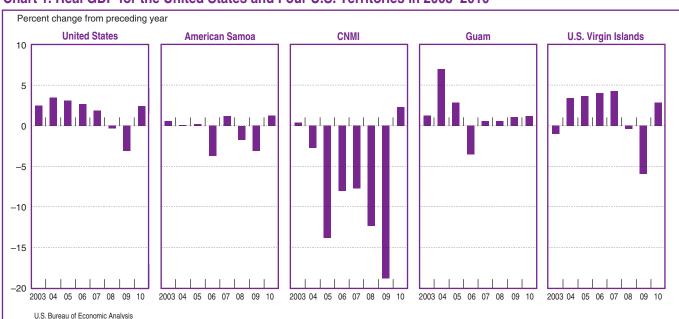

Chart 1. Real GDP for the United States and Four U.S. Territories in 2003–2010

American Samoa

American Samoa's economy grew in 2010 after declining for 2 years. Real GDP increased 1.3 percent, reflecting increases in territorial government spending and in private fixed investment, including construction.

Following the September 2009 earthquake and tsunami, the American Samoan government significantly increased its spending, including hiring temporary workers for cleanup and recovery operations. Construction activity increased as homes and other structures damaged or destroyed by the natural disaster were repaired and rebuilt.¹

Economic growth was tempered by a decline in exports of goods and services that was only partly offset by a decline in imports.² American Samoa's exports of goods, which consisted overwhelmingly of exports of the tuna canning industry, were a major contributor to the decline in total exports in 2010. The decline in the exports of the tuna canning industry reflected the closure of one of the territory's two tuna canneries in the third quarter of 2009.

Consumer spending continued to be a drag on the American Samoa economy in 2010, declining for the 6th consecutive year. The new detailed estimates of consumer spending show that for 2010, spending fell on both goods and services. Net foreign travel, calculated as spending by American Samoan residents abroad less spending by nonresidents in American Samoa, also contributed to the decline in consumer spending, as spending by visitors to the territory outpaced that of residents

traveling abroad.

The GDP by industry estimates show that the private sector and the government sector contributed positively to the growth of the economy in 2010. However, within the private sector, real value added in the manufacturing sector (primarily tuna canning) fell by almost 13 percent.

Total compensation fell in 2010, reflecting a decline in private sector compensation. Private sector compensation fell largely as a result of the tuna cannery closure in 2009. Territorial government compensation, which includes the compensation paid to temporary workers following the earthquake and tsunami, continued to increase in 2010.

Improvements to the estimates for 2002–2009 include the following:

- The incorporation of newly available data for food sold by farms and for food produced and consumed on farms from the U.S. Department of Agriculture's 2008 Census of Agriculture.
- The incorporation of newly available data from the U.S. Census Bureau, including population and housing information from the 2010 Census of Population and Housing and wage and salary data for 2008 and 2009 from County Business Patterns.
- The incorporation of newly available source data for territorial government spending from government financial statements for fiscal year 2010.

The pattern of growth in the revised estimates is similar to that of the previously published estimates. In both the revised and the published estimates, real GDP decreased in 2006, 2008, and 2009 and increased in all other years. The largest revision to real GDP was for 2009 and reflected an upward revision to territorial government spending that was based on the incorporation of information from the American Samoan government's fiscal year 2010 financial statements.

^{1.} GDP, as a measure of an economy's current production of goods and services, is not affected directly by destruction of property caused by natural disasters, except to the extent that it affects production capacity. (The resulting loss of property does have a direct impact on balance sheets.) However, GDP is affected indirectly by the actions that consumers, businesses, and government take in response to the natural disaster, such as increases in government spending for cleanup and recovery operations and increases in construction activity to rebuild damaged assets.

^{2.} Imports are a subtraction in the calculation of GDP.

Commonwealth of the Northern Mariana Islands

After declining for 6 consecutive years largely because of declines in the garment manufacturing industry, the Commonwealth of the Northern Mariana Islands (CNMI)'s economy grew in 2010. Real GDP increased 2.3 percent, reflecting increases in territorial government spending, in consumer spending, and in exports of goods and services. In addition, per capita real GDP for the CNMI increased in 2010, reflecting the growth in real GDP and a continued decline in the population.

Exports increased for the first time after 5 consecutive years of decline. Tourism services (which make up the majority of exports of services) increased due to an increase in the number of visitors to the islands. This increase offset continued declines in exports of goods.

Consumer spending turned up after a significant decline in 2009. The detailed estimates of consumer spending show that expenditures on both goods and services contributed to the increase in overall consumer spending for the year, while net foreign travel contributed negatively.

The GDP by industry estimates show that the distributive services sector (including retail and wholesale trade) and the territorial government were the largest contributors to overall GDP growth in 2010. Meanwhile, the manufacturing sector continued to contribute nega-

tively to economic growth. The significant declines in manufacturing from 2005 to 2009 reflected the decline of the garment manufacturing industry over that time, ending with the last manufacturer closing its doors in the first quarter of 2009.

Total compensation grew in 2010, reflecting increases in both private and government compensation. However, compensation for the manufacturing sector continued to decline, falling each year from 2005 to 2010.

Improvements to the estimates for 2002–2009 include the following:

- Improved methodologies for estimating consumer spending on goods and services.
- •The incorporation of newly available data from the U.S. Census Bureau, including population and housing information from the 2010 Census of Population and Housing and wage and salary data for 2008 and 2009 from County Business Patterns.
- The incorporation of newly available source data for territorial government spending from government financial statements for fiscal year 2010.

The pattern of growth in the revised estimates is similar to that of the previously published estimates. In both the revised and the published estimates, real GDP decreased in all years except 2003.

Guam

Guam's economy continued to grow for the fourth consecutive year. Real GDP grew 1.2 percent in 2010, reflecting increases in territorial government and federal government spending. The trade balance also contributed to economic growth as imports of goods and services declined more rapidly than exports. Economic growth was tempered by a decline in consumer spending.

The detailed estimates of consumer spending show that the decline in 2010 reflected decreases in spending on both goods and services. Within goods, spending on durable and nondurable goods contributed to the decrease. Net foreign travel also contributed negatively to growth in consumer spending.

Tourism contributed positively to economic growth in 2010 for the first time since 2005. Guam's exports of services, which are primarily tourism services, grew 1.2 percent after falling over 13 percent in 2009.

The GDP by industry estimates show that the public sector contributed positively to overall GDP growth in 2010. Also contributing positively were the private con-

struction industry and the accommodations and amusement industry.

Total compensation grew in 2010, reflecting increases in all major sectors of the economy. An increase in compensation of federal government employees was the largest contributor.

Improvements to the estimates for 2002–2009 include the following:

- Improved methodologies for estimating consumer spending on goods and services.
- The incorporation of newly available data from the U.S. Census Bureau, including population and housing information from the 2010 Census of Population and Housing and wage and salary data for 2008 and 2009 from County Business Patterns.
- The incorporation of newly available source data on federal government defense spending.

The pattern of growth in the revised estimates is similar to that of the previously published estimates for all years. In both the revised and the published estimates, real GDP increased in all years except 2006.

U.S. Virgin Islands

After declining for 2 years, real GDP of the U.S. Virgin Islands grew 2.9 percent in 2010. The trade balance contributed significantly to economic growth in 2010 as imports of goods declined more rapidly than exports of goods. As in previous years, the oil refining industry continued to play a major role in the economy, accounting for the vast majority of imports and exports of goods.

The increase in real GDP also reflected increases in government spending and in private fixed investment, primarily construction. Inventory investment, which consists primarily of petroleum products, contributed negatively to economic growth.

Consumer spending grew slightly in 2010. The detailed estimates of consumer spending show that the increase reflected growth in spending on services, particularly on "other" services and health care services. Net foreign travel also contributed positively to the overall growth in consumer spending. Spending on goods, particularly durable goods, decreased.

The tourism industry continued to decline for the

third consecutive year. Exports of services, which are primarily tourism services, fell 2.7 percent in 2010.

Improvements to the estimates for 2002–2009 include the following:

- Incorporating newly available gross business receipts data from the Virgin Islands Bureau of Internal Revenue for 2010 and revised receipts for 2008 and 2009.
- Incorporating improved source data for expenditures in the U.S. Virgin Islands by foreign residents and for expenditures on foreign travel by U.S. Virgin Islands residents; because the resulting revisions were offsetting between consumer spending and net exports of services, GDP was not impacted.
- Incorporating additional information on government spending, including more detailed and higher frequency data for territorial government expenditures.

The pattern of growth in the revised estimates is similar to that of the previously published estimates. In both the revised and the published estimates, real GDP decreased in 2003, 2008, and 2009.

Territorial Economic Accounts

Future Directions

This project represents an important step toward achieving BEA and OIA's long-term goal: to integrate these territories into the full set of U.S. national income and product accounts. A primary obstacle to realizing this goal is the lack of coverage of these four territories by most of the major surveys used by BEA to produce its estimates of GDP and related economic measures. Until the territories are included in these surveys, BEA will continue to depend heavily on the assistance and information provided by each of the territorial governments.

Over the coming months, BEA will continue to work closely with the territorial governments to update the economic accounts for the four territories. Estimates for 2011, in addition to revised estimates for 2002–2010, are scheduled to be released in the spring of 2013.

Future enhancements to the estimates for the four territories (subject to data availability and funding) include developing supplementary measures included in the full set of the U.S. NIPAs, such as personal income and personal saving rates.

Appendix: Summary of Methodologies

The methodologies used to estimate GDP and GDP by industry for American Samoa, the CNMI, Guam, and the U.S. Virgin Islands are summarized in this appendix. These methods are consistent with the methods used to estimate GDP and GDP by industry for the United States (excluding the territories). Information from the Economic Census of Island Areas was used to establish levels of GDP for each territory for 2002 and 2007; for other years, annual series were developed and used to estimate the components of GDP and of GDP by industry.

Gross domestic product

Consumer spending. Personal consumption expenditures (PCE) consists primarily of purchases of goods and services by households.² For American Samoa, the CNMI, and Guam, economic census data on the consumer shares of sales for each industry sector were used to benchmark the estimates of household purchases of most goods. For the CNMI and Guam, annual growth

rates for most goods and services were derived using gross business revenue data, data on imports of goods, and trade source data; for American Samoa, annual growth rates for most goods were derived using data on imports of goods. Annual estimates of goods for the U.S. Virgin Islands were mostly based on imports data from the Census Bureau's *U.S. Trade With Puerto Rico and U.S. Possessions* (series FT895) and *U.S. International Trade in Goods and Services* (series FT900).³

Estimates not benchmarked to economic census data included housing services, utilities services, and financial services, which were estimated independently. Housing services were estimated using information on the number of occupied housing units and average rental rates reported in the Census of Population and Housing. Utilities services were estimated using revenue data reported by government-owned utilities and by the U.S. Energy Information Administration. Other services not covered by the economic census—such as financial services furnished without payment, insurance, and sales by government—were estimated using data from private trade sources and government finance reports.

Private investment. Private investment consists of spending on new fixed assets—equipment, software and structures by private businesses, and improvements to existing assets. It also includes the construction of new residential structures and the improvements to these structures.4 Because of data limitations, estimates of private investment in equipment and software and in structures were indirectly measured. Investment in equipment and software was estimated based on the value of imports of capital goods or on economic census data for the business share of sales of the wholesale durable-goods sector.⁵ Investment in structures was estimated using building permit data, payroll data, and construction industry receipts less sales to other construction firms and less sales to government as reported in the economic census.6

Net exports of goods and services. The estimates of exports of goods to the United States from the four territories reflected data from the Census Bureau's FT895

^{1.} These surveys include merchant wholesale trade and retail trade surveys; the annual capital expenditures survey; value of construction put in place; the service annual survey; the annual survey of manufactures; manufacturers' shipments, inventories, and orders; and government finances. The Census Bureau's County Business Patterns program was recently expanded to include the U.S. territories.

^{2.} A small portion of PCE consists of expenses of nonprofit institutions serving households.

^{3.} It was assumed for both American Samoa and the U.S. Virgin Islands that most consumer purchases of goods were imported.

^{4.} For American Samoa and the U.S. Virgin Islands, private investment also includes private inventory investment (or "change in private inventories").

^{5.} For Guam, after discussion with officials in the Guam Bureau of Statistics and Plans, it was assumed that a majority of the goods purchased by durable-goods wholesalers for resale were imported.

^{6.} The method assumed that the receipts by construction industry reported in the economic census were collected for work done in the same year.

Territorial Economic Accounts

publication. Estimates of exports of goods from American Samoa, the CNMI, and Guam to the rest of the world were based on information compiled by the territorial governments. Estimates of exports of goods from the U.S. Virgin Islands to the rest of the world were based on data from the Census Bureau's FT900 publication. Estimates of imports of goods for American Samoa, the CNMI, and Guam were based on values or quantities of imported commodities reported by the territorial governments. For the U.S. Virgin Islands, estimates of imports of goods reflected data from the series FT895 and FT900 publications.

Information on imports of services and on exports of services other than tourism was limited. Estimates of exports of tourism services for the CNMI and Guam were based on survey data on tourist expenditures and visitor arrivals provided by the territorial government visitors' authorities. For the U.S. Virgin Islands, the estimate of exports of tourism services was based on expenditures of cruise ship passengers available from the Florida-Caribbean Cruise Association and total visitor expenditures provided by the Virgin Islands Bureau of Economic Research.⁷

Government consumption expenditures and gross investment. The estimates of government expenditures were prepared separately for the territorial governments and for the federal government sector. The primary sources of information for the territorial government estimates were financial statements of the primary governments and of the government component units. The primary data sources for the federal government estimates were the Census Bureau's Consolidated Federal Funds Report, and the Federal Procurement Data System. Information on military pay was provided by the Department of Defense.

Estimates of real GDP. Inflation-adjusted estimates of total GDP and its components were derived within a chain-type Fisher Index framework. For most of the detailed components of GDP, inflation-adjusted estimates were calculated by deflating each component using an appropriate price index. Consumer price indexes produced by each territorial government were used to de-

flate most of the detailed components of PCE. Inflationadjusted estimates for most components other than PCE were calculated using U.S. prices from the U.S. Bureau of Labor Statistics.

GDP by industry

Current-dollar estimates. The 2007 estimates of GDP by industry were prepared for broad industry groups using a methodology that was developed to incorporate data from the Economic Census of Island Areas. Current-dollar value added for most private industries was extrapolated using indicators such as gross business revenues and compensation. For select private industries, data were available to separately extrapolate gross output and intermediate inputs. These industries included the manufacturing sector in American Samoa and the CNMI and the goods-producing sector in the U.S. Virgin Islands. Current-dollar value added for the government sector was prepared separately for the territorial government and the federal government sectors; the primary sources of information were the data sources identified for government consumption expenditures and gross investment.

Real estimates. Inflation-adjusted estimates of GDP by industry were derived within a chain-type Fisher Index framework. For most industry sectors, the statistics on chained-dollar value added were prepared using the single-deflation method. Under this method, currentdollar value added of an industry is divided by a gross output price index.8 For industries for which data were available to separately estimate gross output and intermediate inputs, a double-deflation method was used. Under the double-deflation method, current-dollar gross output and current-dollar intermediate inputs are deflated separately, and real value added is computed as the difference between real gross output and real intermediate inputs. Price indexes and other value and quantity data produced by each territorial government, in addition to select U.S. prices, were used in the deflation of value added, gross output, and intermediate inputs.

^{7.} Exports of tourism services were a small component of American Samoa's economy, so they are not discussed.

^{8.} Single deflation approximates the results obtained by double deflation when the prices of an industry's intermediate inputs increase at about the same rate as its output prices.

Acknowledgments

Aya Hamano of the Bureau of Economic Analysis (BEA) and Wali Osman of the Office of Insular Affairs (OIA) oversaw the preparation of the estimates of gross domestic product for American Samoa, the Commonwealth of the Northern Mariana Islands (CNMI), Guam, and the U.S. Virgin Islands.

From BEA, Andrew G. Schmidt prepared the estimates of GDP for American Samoa, Nicole M. Mayerhauser prepared the estimates of GDP for the CNMI and for Guam, and Nadia F. Sadée prepared the estimates of GDP for the U.S. Virgin Islands. Brian C. Moyer, Deputy Director, Brent R. Moulton, Associate Director for National Economic Accounts, and Carol E. Moylan, Associate Director for Industry Economic Accounts, provided overall supervision.

Other significant contributors from BEA were Melissa J. Braybrooks, William A. Jolliff, Erin M. Ludlow, Clinton P. McCully, Edward T. Morgan, William H. Nicolls IV, Sarah J. Pack, Andrew J. Pinard, Bonnie A. Retus, Marlyn Rodriguez, Karl V. Rohrer, and Keith P. Zipay.

The Company Statistics Division of the U.S. Census Bureau provided data from the Economic Census of Island Areas.

From the U.S. Department of the Interior, Tony Babauta, Assistant Secretary for Insular Affairs, and Nikolao Pula, Director of OIA, provided support throughout the project. Lydia Faleafine-Nomura and Basil Ottley of OIA served as liaisons between BEA and the territorial governments.

BEA would also like to thank the governor's offices of the four territories for their contributions. Governor Togiola T.A. Tulafono and Lieutenant Governor Faoa A. Sunia of American Samoa, Governor Benigno Fitial and Lieutenant Governor Eloy Inos of the CNMI, Governor Eddie B. Calvo and Lieutenant Governor Ray S. Tenorio of Guam, and Governor John P. de Jongh and Lieutenant Governor Gregory R. Francis of the U.S. Virgin Islands contributed guidance and support throughout the project.

Other key contributors from each territory are listed below

American Samoa: Lelei Peau, Acting Director, DOC; Ma'u A-Leha, Chief Statistician, DOC; Mine Timoteo, Senior Administrative Assistant, DOC; Alex Zodiacal, Manager-Economic & Business Development Division, DOC; Magalei Logovi'i, Treasurer, Department of Treasury (DOT); Melvin Joseph, Manager, Tax Office, DOT; Glen Lefiti, Chief Customs Officer, DOT; Malemo

Tausaga, Director, Budget Office; Aleki Sene, CEO, American Samoa Telecommunications Authority; Andra Samoa, CEO, American Samoa Power Authority; Michael Gerstenberger, CEO, LBJ Medical Center; Seth Galea'i, Dean, American Samoa Community College; Sione Kava, Petroleum Officer, Office of Petroleum Management; Brett Butler, General Manager, Star Kist Samoa.

CNMI: Sixto Igisomar, Secretary, Department of Commerce; Ivan A. Blanco, Deputy Secretary, Department of Commerce; Alfonis M. Sound, Director, Central Statistics Division (CSD); Perry Inos Jr., Former Director, CSD; Justin H. Andrew, Computer Specialist, CSD; Fermin Sakisat Jr., Statistics Specialist, CSD; Edward Deleon Guerrero, Executive Director, Commonwealth Ports Authority (CPA); MaryAnn Q. Lizama, Manager of the Port of Saipan, CPA; Derek T. Sasamoto, Comptroller, CPA; Perry J. P. Tenorio, Director, Marianas Visitors Authority (MVA); Judy C. Torres, Deputy Director, MVA; Larissa Larson, Secretary, Department of Finance (DOF); Pam Halstead, Business License Analyst, DOF; Canice Diaz, Revenue Agent, DOF; Marie T. Muna, Computer Programmer, DOF; Vivian P. Nogis, Statistics Specialist, DOF.

Guam: Franklin P. Arriola, Chief of Staff, Office of the Governor; Henry Taitano, Special Assistant for Social and Economic Affairs, Office of the Governor; Thomas A. Morrison, Director, Bureau of Statistics and Plans (BSP); Albert Perez, Chief Economist, BSP; Benita A. Manglona, Director, Department of Administration; George A. Santos, Director, Department of Labor (DOL); Gary Hiles, Chief Economist, DOL; John Camacho, Director, Department of Revenue and Taxation (DRT); Marie Benito, Deputy Director, DRT; John A. Rios, Director, Bureau of Budget and Management Research; Karl Pangelinan, Administrator, Guam Economic Development Authority; Doris F. Brooks, Public Auditor, Office of the Public Auditor; Joann G. Camacho, General Manager, Guam Visitors Bureau (GVB); Deborah M. Phillips, Research Manager, GVB.

U.S. Virgin Islands: Wharton Berger, Director, Virgin Islands Bureau of Economic Research (VIBER); Donnie Dorsett, Economist, VIBER; Claudette Watson-Anderson, Director, Virgin Islands Bureau of Internal Revenue; Valdamier O. Collens, Executive Assistant Commissioner, Virgin Islands Department of Finance; Sandra Rey, Senior Research Analyst, Virgin Islands Department of Labor; Virgin Islands Office of Management and Budget.

Research Spotlight A Prototype BEA/BLS Industry-Level Production Account for the United States

By Susan Fleck, Steven Rosenthal, Matthew Russell, Erich H. Strassner, and Lisa Usher

In RECENT YEARS, structural changes at the industry level in the United States and their implications for competitiveness have emerged as important economic issues. The most recent business cycle and subsequent recovery in particular led to heightened interest in understanding the sources of economic growth, including output, input, and multifactor productivity (MFP) growth across all industries in the U.S. economy.

To better understand the sources of economic growth, productivity statistics integrated with gross domestic product (GDP) statistics have long been sought as a rich source of information for policy makers, business analysts, and economists. The usefulness of such integrated statistics on the sources of growth within the framework of the U.S. national income and product accounts (NIPAs) was first presented by Jorgenson and Landefeld (2006) in *A New Architecture for the U.S. National Accounts*. In that same volume, Fraumeni, Harper, Powers, and Yuskavage (2006) established the groundwork for a collaboration by the Bureau of Economic Analysis (BEA) and the Bureau of Labor Statistics (BLS) to create a production account.

Since 2010, the two agencies have been working toward creating a prototype production account. This *Research Spotlight* summarizes a lengthier, more detailed report on the prototype integrated production account that was recently published on the BEA Web site.

The initial results of the prototype account show the following:

 In 1998–2010, capital accounted for about 60 percent of U.S. economic growth, labor accounted for about 10 percent, and MFP accounted for about 30 percent of growth.

Susan Fleck, Steven Rosenthal, and Lisa Usher are economists in the Office of Productivity and Technology at the Bureau of Labor Statistics. Matthew Russell and Erich Strassner are economists in the Industry Economic Accounts Directorate at the Bureau of Economic Analysis.

•In 48 out of 63 industries, at least one KLEMS (K-capital, L-labor, E-energy, M-materials, and S-pur-chased services) input to production was a more important source of real gross output growth than was MFP.

GDP by industry statistics provide detailed information on the industry sources of aggregate value added growth but do not include estimates of the contributions of capital and labor inputs and MFP to economic growth. MFP measures provide detailed information on the output per unit of capital, labor, and intermediate inputs. MFP growth is calculated as the growth that cannot be explained by changes in the combined contribution of these three factor inputs. The official MFP measures provide information on components of economic growth in the market economy but do not report detailed information on the nonmarket economy. While these two sets of statistics share a common economic accounting framework, in the United States, they are prepared by two separate agencies. GDP statistics are published by BEA, of the U.S. Department of Commerce. Labor productivity and MFP statistics are published by BLS of the U.S. Department of Labor. Differences in concepts and methods used by each agency persist because of the different nature of each program, but each statistical program depends on the other to prepare its official measures.

To estimate the contributions of MFP and each input to individual industries' output growth and to growth in the total gross output of the economy, economy-wide MFP measures have been developed in a joint exercise by BLS and BEA. This prototype account builds on the GDP by industry statistics produced by BEA and the capital, labor and MFP statistics produced by BLS to assemble an industry-level production account for the United States that is consistent with GDP. The key feature of this internally consistent prototype account is to provide values, prices, and quantities of outputs and inputs used in the industry production process. This set of accounts allows one to decompose the industry contributions of inputs and

MFP and identify them as sources of GDP growth at the aggregate level.

This prototype, integrated economy-wide account for the United States spans 1998–2010 on a 2002 North American Industry Classification (NAICS) basis and covers all NIPA-level industries in the market and non-market sectors. The account incorporates gross output, value added, and intermediate inputs (which comprises energy, materials, and purchased services) statistics by industry from BEA and labor and capital input measures by industry from BLS. Both the BEA and BLS data are consistent with the annual industry accounts statistics as of December 2011. The BLS labor and capital measures reflect adjustments that were made where necessary to provide consistency in concepts and coverage for this prototype account.¹

The prototype production account presents contributions of KLEMS inputs and MFP to gross output growth for the total economy at the NIPA-industry level, or roughly the three-digit NAICS level of industry detail, based on a gross-output production accounting framework.² The gross output concept differs from the sectoral concept used by BLS in its industry-level MFP statistics. The sectoral approach excludes intermediate production and purchases that come from within the industry (that is, intraindustry transactions) from both output and inputs. This is the primary conceptual difference between the MFP measures presented here and the official BLS productivity statistics.³ Both approaches are discussed in Schreyer (2001).

In this production account, we used the gross-output approach because it provides a clear crosswalk to published BEA statistics on GDP, GDP by industry, and the input-output accounts, including estimates of gross output, value added, and intermediate inputs by industry. The starting point for this prototype production account is the fundamental economic accounting identity that (assuming zero profits), the value of gross output equals the value of payments for KLEMS inputs to production, including intraindustry transactions. The complete set of accounts decomposes changes in these values over time into changes in prices and changes in quantities, thus permitting an index number estimate of MFP growth by industry. This study also includes estimates of the Domar-weighted contributions of industry MFP to economy-wide MFP.⁴ We also include illustrative results of a labor composition adjustment to BLS industry labor hours in order to better understand its impact on estimating the contribution of labor input and MFP by industry. This adjustment for labor composition reflects the heterogeneity of each industry's workforce and yields a symmetric treatment of labor and capital services.

The remainder of the article discusses the following:

- Results of the prototype industry-level account
- The methodology for this prototype industry-level account
- The conceptual and measurement challenges that require resolution before this account can be released on a regular basis
- Possible future work and next steps in this important collaboration

Acknowledgments

We thank Billy Jolliff, Sarah Osborne, and Peter Kuhbach of the Bureau of Economic Analysis (BEA) and Kevin Delaney, Mark Dumas, Bhavani Khandrika, and Randall Kinoshita of the Bureau of Labor Statistics (BLS) for substantial contributions to the development of this prototype account. Carol E. Moylan of BEA and John Ruser of BLS provided valuable guidance to this project.

We are also grateful to Dale Jorgenson of Harvard University and BEA's Advisory Committee, Mun Ho of The Institute of Quantitative Social Science at Harvard University, and Jon Samuels of BEA for their advice and consultation throughout this project and for sharing underlying data sets from their work, which proved to be of great benefit in developing this account.

We are also grateful for the helpful comments we received at the 2nd World KLEMS conference held at Harvard University on August 9–10, 2012.

^{1.} BLS regularly publishes labor and capital measures that are consistent with NIPA industry-level definitions, but with differences in coverage and concepts that will be discussed later in this paper. For this account, we incorporate data across all legal forms of organization at the industry level to ensure consistency with GDP.

^{2.} Jorgenson, Gollop, and Fraumeni (1987) and Jorgenson, Ho, and Stiroh (2005) rely on gross output measures.

^{3.} The National Academy of Sciences (1979) (Reese) Panel to Review Productivity Statistics recommended a sectoral framework for measuring productivity. Aggregating industry-level sectoral output to the total economy produces value-added output. The sectoral framework provides a unifying rationale of output measurement from detailed industry to major sectors.

^{4.} Domar weights consist of the ratio of an industry's current dollar gross output divided by aggregate value added. These weights are unique in that they sum to more than one, reflecting the fact that an increase in an industry's productivity has a direct effect on the industry's output as well a secondary effect through the output of one industry delivered to another as intermediate inputs. All industries' Domar-weighted MFP growth, when summed, roughly equal economy-wide MFP.

A First Look at the Results

This prototype, BEA/BLS industry-level production account can be used to trace the sources of U.S. economic growth across all goods-producing and services-producing industries in the U.S. economy in 1998–2010 (chart 1 follows the article). This new production account presents the contributions of both value added and intermediate input factors of production and the contribution of MFP to real gross output growth, at roughly the three-digit NAICS industry level as published in the annual industry accounts.

The new account provides a wealth of useful information by measuring the contributions of output growth from each industry's KLEMS inputs—both its primary, value added inputs (capital and labor), and its secondary, intermediate inputs (energy, materials and services)—and from MFP. That information can be used to estimate key contributions to economic growth. Table A presents the sources of aggregate value added growth (economic) for the United States that are attributable to the primary, value added inputs (capital and labor) and to MFP.

Table A. Contributions to Economywide Value-Added Growth in 1998–2010

Value-added growth for all industries	1.90
Labor input	0.20
College graduate	0.46
No college degree	-0.25
Capital input	1.15
Aggregate multifactor productivity	0.56

 $\,$ Note. Growth is expressed as the difference in natural logs. The components may not sum to totals because of rounding.

Table B extends the analysis by showing the contributions of all KLEMS inputs and MFP on gross output

growth. Gross output is a broad measure of economic activity that includes intermediate activity, that is, economic activity used in the production process. GDP is defined as gross output less spending on intermediate inputs (energy, material and purchased services).

Table B ranks the NIPA-level industries by largest positive contribution of intermediate inputs, capital and labor. The contributions from at least one of the primary, value added inputs (capital and labor) or secondary, intermediate inputs (energy, materials, and purchased services) were greater than MFP growth in more than 75 percent of the 63 industries included in this account.

In the three industries with the largest percent changes in gross output—support activities for mining; securities, commodity contracts, investments; and information and data processing services—intermediate input contributions were the largest contributor to the percent changes in gross output, reflecting their relative weight as well as recent trends in the sourcing of production (table B). In 6 of the top 10 industries with the strongest output growth, intermediate inputs were the most significant factor. Conversely, in all but one of the 10 industries that showed the largest output decline, negative intermediate input contributions were the largest contributors.

Among capital-intensive industries, "rental and leasing" and "information and data processing services" were among the industries with the largest capital contributions to output growth (table B). For rental and leasing, capital contributed 2.89 percentage points to output growth of 1.7 percent. For information and data processing services, capital contributed 1.76 per-

centage points to real output growth of 7.8 percent.

Similarly, several labor-intensive industries had the highest labor contribution to output growth (table B). Computer systems design and related services, education services, and ambulatory health care services were among the industries with the highest labor contributions to output growth.

Methodology

This section provides a brief overview of the conceptual framework and estimation methods used to prepare the prototype BEA/BLS industry-level production account. It describes the gross-output growth accounting framework, discusses the estimation methods used to prepare our results, and summarizes the source data methods used by BEA and BLS to produce the gross output, value added, intermediate inputs, capital input, and labor input used in this account, including adjustments we made to achieve better integration of these data sets.

Conceptual overview of measurement

For the prototype BEA/BLS production account framework, we assume the following type of production function relating gross output of an industry to three factor inputs using the gross output production function model: Q = F(K, L, II, t) where Q stands for gross output, K stands for capital inputs, L stands for labor inputs, II stands for the intermediate inputs, and t stands for time.⁵

Under the assumption of constant returns to scale, perfect competition, and factors being paid their marginal product, the gross-output growth model can be rearranged in terms of MFP growth computed in the following, simplified ways.

$$\frac{d \ln Q}{dt} = \left(\left(\frac{\delta \ln Q}{\delta \ln K} \right) \cdot \left(\frac{d \ln K}{dt} \right) + \left(\frac{\delta \ln Q}{\delta \ln II} \cdot \frac{d \ln II}{dt} \right) + \left(\frac{\delta \ln Q}{\delta \ln L} \cdot \frac{d \ln L}{dt} \right) + \left(\frac{\delta \ln Q}{\delta t} \right) \right)$$

$$\frac{\delta \ln Q}{\delta t} = \frac{d \ln Q}{dt} - \left(\frac{\delta \ln Q}{\delta \ln K} \cdot \frac{d \ln K}{dt}\right) - \left(\frac{\delta \ln Q}{\delta \ln \Pi} \cdot \frac{d \ln \Pi}{dt}\right) - \left(\frac{\delta \ln Q}{\delta \ln L} \cdot \frac{d \ln L}{dt}\right)$$

With the above assumptions, the unknown elasticities can be replaced with the observable factor share

 v_i for each input. Shown below is the factor share for capital input:

$$\frac{\delta lnQ}{\delta lnK} = \frac{P_K K = Capital Compensation}{(P_K K + P_L L + P_{II} II) = Total Compensation} = v_K$$

Where P_K is the price of capital, P_L is the price of labor, and P_{II} is the price of intermediate inputs.

The assumption of constant returns to scale ensures that the factor shares sum to one.

$$\frac{P_{II}II}{(P_KK + P_LL + P_{II}II)} = v_{II}$$

$$\frac{P_KK}{(P_KK + P_LL + P_{II}II)} = v_K$$

$$\frac{P_LL}{(P_KK + P_LL + P_{II}II)} = v_L$$

Where $v_K + v_L + v_{II} = 1$ In discrete time, the input weights are 2-year averages of the cost shares for each input in years t and t-1, where $\tilde{v}_K = \frac{1}{2}v_{K,t} + \frac{1}{2}v_{K,t-1}$

MFP growth can be rewritten in the following way, relating MFP growth for an industry as the residual of the difference in the growth in output and the growth in the combined inputs:

$$MFPgrowth = \Delta ln Q - v_{K} \Delta ln(K) - v_{L} \Delta ln(L) - v_{H} \Delta ln(II)$$

There are no assumptions restricting individual industries in this analysis of MFP; each industry faces the above production function individually and without regard to any other industry.

Estimation methods

The MFP index is computed by dividing an index of real gross output by an index of combined inputs. A combined real input measure is computed using a Tornqvist index number formula that aggregates real intermediate inputs by industry for energy, materials, and purchased services with the labor and capital input using average cost shares.⁶

^{5.} For simplicity, we express total intermediate inputs instead of the separate cost components of energy, materials, and purchased services.

This model is also used by the BLS for its published measures for the business sector, with the exception that Q is sectoral output and II reflects the subtraction of intraindustry inputs from intermediate inputs.

^{6.} BEA's national and industry accounts use Fisher-ideal indexes to express official chain-type price and quantity indexes. This study follows the productivity literature and uses the Tornqvist index for aggregation.

The current-dollar cost shares of the three main input components are generated using published and computed data sets. The current dollar intermediate inputs measure is a sum of the current-dollar energy, material, and purchased-services expenditures of an industry from the BEA annual industry accounts. The current dollar labor component is a measure of the compensation of workers in that industry. The BEA published labor compensation statistics are supplemented to include the self-employed compensation estimate using the assumption that self-employed workers receive similar wages to the payrolled employees. Lastly, current-dollar capital compensation is computed as a residual of the value of gross output less the sum of labor compensation and intermediate input expenditures.7

The average share of intermediate inputs is an industry's current-dollar expenditure on energy, materials, and services divided by the value of the industry's gross-output production averaged over two periods. The average share for the remaining inputs is computed in a similar fashion. The KLEMS measures are aggregated using the average cost shares and the quantity indexes of each input.

BEA's industry accounts provide a time series of current-dollar and real gross output, intermediate inputs, and value added defined according to the 2002 NAICS (Mayerhauser and Strassner, 2010). These accounts are integrated conceptually and statistically with final expenditures and GDP from the NIPAs and are prepared within a balanced input-output framework that allows for integrated analysis of industry output, inputs, employment, and final demand. In 2005, these accounts were expanded to provide additional information on the composition of intermediate inputs by industry, which made these accounts more useful in observing changes in spending related to energy, materials, and purchased services (Strassner, Medeiros, and Smith 2005).

Capital inputs are computed in accordance with a service flow concept for physical capital assets—equipment, structures, inventories, and land. Capital inputs are calculated in three steps: (1) a detailed array of capital stocks is identified for asset types in each industry; (2) asset-type capital stocks are aggregated by industry

to measure capital input for each industry; and (3) industry capital inputs are aggregated to measure sector-level capital input. The development of nonmanufacturing productivity measures in 2010 created the foundation for the development of capital service measures for economy-wide NIPA-level industries (Harper, Khandrika, Kinoshita, and Rosenthal, 2010).

The labor hours reflect annual hours worked of all employed persons. Hours are measured separately for different categories of workers in each industry and are then summed. Hours for each industry and category of worker are calculated as the product of employment, average weekly hours, and 52 weeks per year. The hours are also adjusted to reflect hours at work. Hours worked for NIPA-level industries are based on the data and methods used to calculate hours in the BLS detailed industry productivity and cost measures, and were aggregated from estimates for more detailed industries. Industry classifications were adjusted where necessary to improve consistency with the BEA industry accounts.

Conceptual and Measurement Challenges

This prototype industry-level production account represents an important step in integrating the national accounts with MFP statistics. However, concerns and challenges remain. Differences arise in part because of the different goals of BEA and BLS. BEA's mission is to promote a better understanding of the U.S. economy by providing the most timely, relevant, and accurate economic accounts, which has led to the development of a set of accounts that provides complete and consistent coverage of the domestic output of the entire economy. BLS's mission is to provide maximum reliability in its productivity measures using economic concepts and methods that are most appropriate for measuring productivity and to ensure consistency between its official labor productivity series and multifactor productivity series.

As a result, some of the data presented here reflect differences in concepts and coverage from the official BLS productivity data. The effort to measure industry output and productivity covering the total economy, while consistent with domestic GDP, differs from the BLS approach. The official BLS productivity measures reflect the market sector rather than the total economy. They exclude certain activities (such as government,

^{7.} This is a common assumption in productivity literature and ensures that the factor shares sum to unity.

November 2012 49

private households, and nonprofit institutions) because of conceptual challenges in measuring output and capital in the nonmarket sector. In addition, the use of a gross output concept for measuring multifactor productivity in the production accounts contrasts with the sectoral output approach used in the BLS industry multifactor productivity measures.

Conclusions and Possible Next Steps

This research marks a significant milestone toward creating an integrated, industry-level production account for the United States. It builds on a long-standing history of collaboration between BEA and BLS and illustrates the importance of understanding the sources of economic growth, including KLEMS inputs and MFP growth, within an integrated national economic accounts framework, as first described by Jorgenson and Landefeld (2006).

However, much work remains before a BEA/BLS industry-level production account will be released on a regular basis. Challenges include an increasingly tough budgetary resource environment for introducing new initiatives in addition to methodology considerations seeking resolution in future work by BEA and BLS on this account.

The full report on the prototype, integrated industry-level production account is available on the BEA Web site www.bea.gov/industry and on the BLS Web site at www.bls.gov/mfp.

U.S. Multinational Companies

Operations of U.S. Parents and Their Foreign Affiliates in 2010

By Kevin B. Barefoot

THE OPERATIONS of U.S. multinational companies (MNCs) grew in 2010, reflecting continued growth in their operations abroad and renewed growth in their operations in the United States. The worldwide current-dollar value added of U.S. MNCs—the combined value added of U.S. parent companies and their majority-owned foreign affiliates (MOFAs)—increased 10.3 percent in 2010 (table 1).1

This article presents preliminary results from the 2010 Annual Survey of U.S. Direct Investment Abroad conducted by the Bureau of Economic Analysis (BEA). This survey covers the worldwide operations of U.S. MNCs in all industries. A longstanding purpose of this survey is to collect data that can be used to evaluate the consequences to the economies of the United States and foreign host countries of the actions of U.S. MNCs. Understanding the actions of these companies requires a conceptual framework in which an economic actor controls the global activities of an MNC. The domestic operations of a U.S. MNC, called the U.S. parent, are defined to include all domestic operations that are majority-owned, which implies control. Similarly, all majority-owned foreign operations of U.S. MNCs are defined to be under the U.S. owner's control. Most foreign affiliates are in fact majorityowned; MOFAs accounted for 83.5 percent of employment by all foreign affiliates in 2010. Partly for these reasons, the examination of foreign operations of U.S. MNCs in this article generally focuses on data for MOFAs rather than on data for all foreign affiliates. In addition, some of the data necessary for the analysis in this article are collected only for MOFAs.

For the remainder of this article, MOFAs will be referred to, simply, as "foreign affiliates." The main focus of this article is the change in 2010 in four aspects of U.S. MNC operations: value added, employment, U.S. trade in goods, and research and development (R&D).

The 10.3 percent increase in U.S. MNCs' value added in 2010 reflected an 11.2 percent increase in the value added of U.S. parents and an 8.4 percent increase

in the value added of their foreign affiliates. The 11.2 percent increase for U.S. parents reflected the U.S. economic recovery as well as favorable conditions in specific industries. Increases were greatest in manufacturing, particularly petroleum-related industries, and in finance and insurance. Except in Europe, the strong growth in foreign affiliates' value added was widespread geographically and was most pronounced in Asia and Pacific and Latin America and Other Western Hemisphere.

Employment by U.S. MNCs worldwide increased 0.5 percent, reflecting partly offsetting changes in the United States and abroad. Employment in the United States by U.S. parents decreased 0.5 percent, in contrast to the 11.2 percent increase in their value added. The divergence in growth rates between employment and value added reflected the fact that growth in parents' value added was concentrated in industries in which production is intensive in physical or financial capital, such as petroleum and finance. Employment abroad by foreign affiliates increased 2.6 percent. In addition, capital expenditures by U.S. MNCs increased 1.0 percent, reflecting an increase in the United States

Acknowledgments

The 2010 annual survey was conducted under the direction of David H. Galler, Patricia C. Walker, and Barbara K. Hubbard. Mark D. Goddard supervised the editing and processing of the reports.

Crim, Laura A. Downey, Andre Garber, Brian C. Goddard, David L. Grayton, Kenneth T. Grier, Carole J. Henry, Jennifer A. Jones, Neeta B. Kapoor, James P. Lashley, Sherry S. Lee, Da-Chin Lin, Kevin McCarthy, Ashieda McKoy, Marcia S. Miller, Amanda M. Petersen, Robert B. Platner, Daniel W. Powell, Kevin J. Reagan, Robert L. Ruiz, Myriam B. Rullan, Aqeel A. Sahibzada, James Y. Shin, Gary E. Sowers, Nancy F. Steffen, and Monique N. Sumpter.

^{1.} Value added measures the dollar value of the firm's own production. See the box "Key Terms" on page 56. A MOFA is a foreign affiliate in which the combined ownership of all U.S. parents exceeds 50 percent.

that was partly offset by a decrease abroad. R&D expenditures by U.S. MNCs increased 2.2 percent, reflecting increases both in the United States and abroad.

Highlights of U.S. MNC operations in 2010 include the following:

- The 10.3 percent growth in the value added of U.S. MNCs followed a slight decline in 2009. The upturn partly reflected an increase in crude oil prices and the impact of the global economic recovery. In 2010, crude oil prices increased nearly 30 percent, which led to increased revenues for both U.S. parents and foreign affiliates in crude oil extraction and integrated oil extraction and refining.2
- The value added of U.S. parents grew faster in 2010 than foreign affiliates' value added, in contrast to the pattern of growth from 1999 to 2009. The shift in the pattern of growth partly reflected a significant increase in value added of U.S. parents in finance and insurance, which, in turn, reflected improvement in the U.S. credit environment and increases in sales of financial services such as investment banking and loans to consumers and businesses.
- The operations of U.S. MNCs remained concentrated in the United States. U.S. parents accounted for more than two-thirds, and foreign affiliates accounted for less than one-third, of MNC's combined value added, capital expenditures, R&D, and employment.
- Most foreign affiliates continued to be located in high-income countries. Affiliates in these countries accounted for about 71 percent of the value added of all affiliates in 2010, which was unchanged from that in 2009 (chart 1).
- U.S. MNCs continued to account for a large share of the U.S. trade in goods. Trade associated with U.S. parents or their foreign affiliates accounted for 48.1 percent, or \$615.3 billion, of total U.S. exports of goods and 42.4 percent, or \$810.5 billion, of total U.S. imports of goods.
- U.S. parents, although relatively small in number, accounted for more than a fifth of value added of all U.S. businesses in 2010. They also accounted for large shares of tangible inputs to production, accounting for more than 40 percent of capital expenditures by all U.S. businesses and for more than 20 percent of employment by all U.S. businesses. U.S. parents are leaders in innovation in the U.S. economy, accounting for 73.4 percent of R&D expenditures by

^{2.} Data on the composite refiner acquisition cost of crude oil are from "Table 1. Crude Oil Prices," in Petroleum Marketing Monthly (Washington, DC: U.S. Department of Energy, Energy Information Administration, October 2012). Go to www.eia.gov/petroleum, and click on "analysis & projections," "all reports," and then on "petroleum marketing monthly."

^{1.} For the years shown prior to 2007, the data items needed to calculate value added for individual U.S.

^{1.} For the years shown prior to 2007, the dual terms needed to calculate value added and individual or parents and foreign affiliates were collected for nonbank businesses only. The value added statistics for bank parents and affiliates for those years are estimates.

2. Break in series, Beginning with 1998, BEA expanded its statistics to include data for "very small" foreign affiliates and for parents that had only "very small" foreign affiliates. For details, see the technical note on page 121 of the December 2002 Survey of Current Business.)

3. For 1989, 1994, 1999, and 2004, the capital expenditure data for individual U.S. parents and foreign affiliates were collected for nonbank businesses only. The capital expenditure statistics for bank parents and affiliates for those years are estimates.

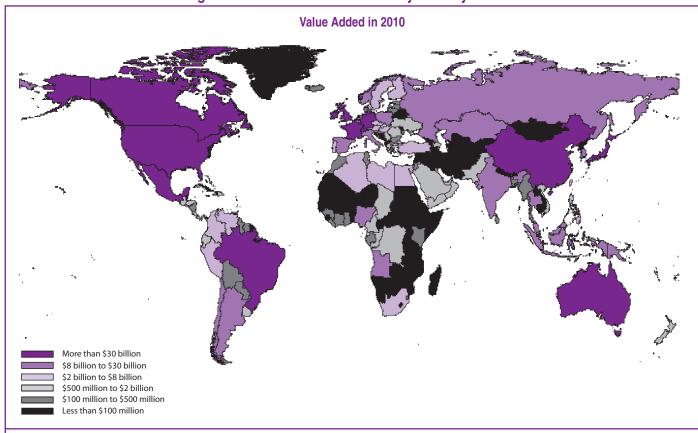

atles for those years are estimates.

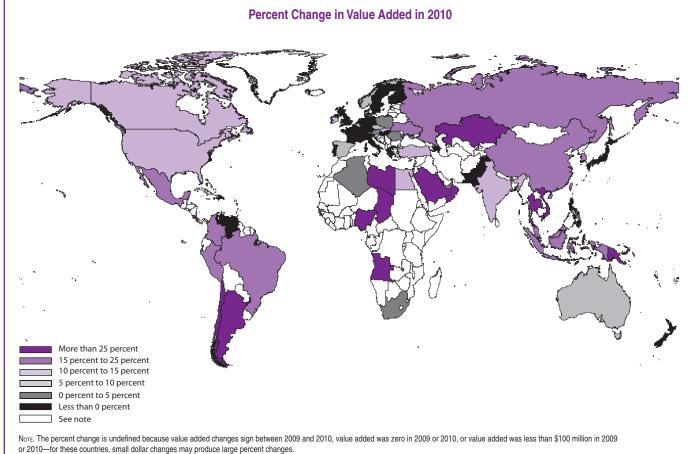

4. For the years shown prior to 2009, data on R&D expenditures were collected for nonbank U.S. parents and foreign affiliates only. R&D expenditures are assumed to be zero for bank U.S. parents and foreign affiliates

MOFA Majority-owned foreign affiliate

U.S. Bureau of Economic Analysis

Chart 1. Value Added and Change in Value Added of U.S. MNCs by Country

- all U.S. businesses in 2009.3 U.S. MNCs' R&D expenditures totaled \$252.0 billion. They accounted for 84.3 percent and foreign affiliates accounted for 15.7 percent of the total. Foreign affiliates' R&D expenditures were largest in Europe and in Asia and Pacific.
- Employment by foreign affiliates in the professional, scientific, and technical services industry sector increased 5.9 percent, compared with a 2.6 percent increase in employment for all foreign affiliates. Over the last decade, employment at foreign affiliates in this sector maintained strong growth, as U.S. MNCs have relied more on foreign affiliates in this sector to support their domestic operations. Employment in these support operations is largest in Asia and Pacific, especially in India. By utilizing their foreign affiliates in low-cost locations with the capacity to provide these services, U.S. MNCs can realize efficiencies and maintain a competitive advantage.

Changes in Value Added

U.S. MNCs

In 2010, value added of U.S. MNCs increased both in the United States and abroad, partly reflecting the global economic recovery. The increase also reflected many MNCs' focus on innovation, which enables them to produce new, higher value goods or to discover more efficient ways of producing the same good. This focus on innovation contributes to long-term economic growth and productivity in their home and foreign host countries.⁴

In current dollars, the value added of U.S. MNCs grew 10.3 percent to \$4,127.2 billion in 2010 from \$3,740.7 billion in 2009 (table 2). The value added of U.S. parents grew 11.2 percent to \$2,885.9 billion, and the value added of foreign affiliates grew 8.4 percent to \$1,241.3 billion. In real terms, the value added of MNCs appears to have increased in 2010, reflecting an 11.2 percent increase in the current-dollar value added of parents, which exceeded the 1.4 percent increase in U.S. prices (as measured by the implicit price deflator for value added of U.S. nonfarm businesses). Moreover, the 8.4 percent increase in the current-dollar value added of foreign affiliates exceeded the increase that could be attributed to the combined effects of the 1.4 percent average annual rate of inflation in host countries and the 2.3 percent depreciation of the dollar against major foreign currencies.⁵ In addition, BEA's statistics on the real value added of foreign affiliates in manufacturing show an increase of 6.7 percent in 2010 (see "Real value added in manufacturing" on page 63). By industry, roughly two-thirds of the growth in current-dollar value added of U.S. MNCs was accounted for by manufacturing—primarily petroleum-related manufacturing—and by finance and insurance.

In 2010, two key tangible inputs to U.S. MNC production, capital expenditures and employment, increased. Capital expenditures increased 1.0 percent to \$604.6 billion. The increase reflected a 1.5 percent increase for U.S. parents that was partly offset by a 0.5 percent decrease for foreign affiliates. By industry, U.S. MNCs' capital expenditures increased for most major

⁽D) Suppressed to avoid disclosure of data of individual companies.

^{3.} Data on R&D performed for U.S. businesses are from "Table 1. Funds Spent for Business R&D Performed in the United States, by Source of Funds and Size of Company: 2008 and 2009" in Raymond M. Wolfe, "Business R&D Performed in the United States Cost \$291 Billion in 2008 and \$282 Billion in 2009," National Science Foundation (NSF) *Info Brief* NSF12–309 (Washington, DC: NSF, March 2012). To access this table, visit www.nsf.gov/statistics/infbrief/nsf12309. The data for 2010 were not available in time for this article.

^{4.} For example, see Carol Corrado, Paul Lengermann, and Larry Slifman, "The Contribution of Multinational Companies to U.S. Productivity Growth" in *International Trade in Services and Intangibles in the Era of Globalization*, ed. Marshall Reinsdorf and Matthew Slaughter (Chicago: University of Chicago Press, 2009): 331–360.

^{5.} The rate of inflation in 12 major euro area countries and in 13 other major host countries was 1.4 percent in 2010. Together, these countries accounted for 74 percent of total value added of foreign affiliates in 2010. The average inflation rate (weighted by foreign-affiliate value added) in these countries was derived from data on gross domestic product (GDP) implicit price deflators from the IMF *International Financial Statistics*. The weighted average U.S.-dollar price of the currencies of these countries in foreign exchange markets increased 2.3 percent in 2010. This means that value added measured in foreign currency increased 2.3 percent on average when converted to U.S. dollars because the foreign currency buys more dollars.

industry groups, especially in retail trade and in petroleum-related manufacturing.

Employment by U.S. MNCs increased 0.5 percent, or 0.2 million workers to 33.9 million in 2010, reflecting partly offsetting changes for U.S. parents and foreign affiliates. Employment by U.S. parents decreased 0.5 percent to 22.8 million. Employment by foreign affiliates increased 2.6 percent to 11.1 million.

Employee compensation of U.S. MNCs increased 1.4 percent to \$2,100.7 billion in 2010. The average compensation per employee was roughly \$62,000. The average wages paid by U.S. MNCs tend to be higher than those paid by other businesses in their host economies, partly reflecting the higher average skill level of workers and the relatively more capital intensive production processes of MNCs compared with purely domestic firms. In 2010, the average wage paid by U.S. parent companies was roughly \$71,000, compared with \$57,000 for all U.S. businesses. The average wage paid by foreign affiliates in seven selected countries of the European Union in 2010 was 39 percent higher, on average, than the average wage paid by all businesses in those countries.6

In 2010, U.S. MNCs' R&D expenditures increased 2.2 percent to \$252.0 billion. R&D expenditures of U.S. parents increased 2.5 percent to \$212.5 billion, and expenditures of foreign affiliates increased 0.7 percent to

\$39.5 billion. By industry, increases in R&D expenditures were concentrated in manufacturing, primarily pharmaceuticals, followed by information and professional, scientific, and technical services.

U.S. parents

The 11.2 percent growth in the value added of U.S. parents was the strongest since 2000, and reflected increases in nearly all major industries (table 3). The increases in U.S. parents' value added were largest in manufacturing and in finance and insurance, which together accounted for more than 60 percent of the increase. In manufacturing, value added increased 9.4 percent, reflecting increases in nearly all major manufacturing industry groups. The increases were led by "other" manufacturing—primarily petroleum-related manufacturing—and computers and electronic products manufacturing. In finance and insurance, value added increased 30.8 percent. The increase partly reflected improved financial market conditions related to the global economic recovery. For example, investment banking revenues increased partly as a result of a 23 percent increase in global mergers and acquisitions.7 In addition, mortgage loans increased, partly in response to a 3.7 percent increase in U.S. housing starts.8

^{6.} These countries are Belgium, France, Germany, Italy, the Netherlands, Spain, and the United Kingdom. The average wage data are from the Eurostat Web site. To access the data, visit epp.eurostat.ec.europa.eu, and type the data series code (earn_ses10_26) in the search box.

^{7.} Thompson Reuters data cited in Liz Mover, "Global M&A Raised \$2.4 Trillion in 2010," Wall Street Journal (January 4, 2011).

^{8.} The data are from the U.S. Bureau of the Census, New Residential Construction, "Housing Units Authorized in Permit-Issuing Places." To access these data, visit www.census.gov/construction/nrc, and click on "historical data," "authorized by building permits."

⁽D) Suppresed to avoid disclosure of data of individual companies. n.a. Not available. 1. Statistics for all U.S. companies are from BEA's GDP by industry series.

Statistics for all U.S. companies are from the Census Bureau Annual Capital Expenditures Survey (Table a. Capital Expenditures for Structures and Equipment for Companies With Employees by Industry).
 Statistics for all U.S. companies are from the National Science Foundation, Research and Development

in Industry.

4. Statistics for all U.S. companies are from BEA's national income and product accounts (NIPA Table 6.2D.

Compensation of Employees by Industry).

5. Statistics for all U.S. companies are from BEA's national income and product accounts (NIPA Table 6.4D. Full-Time and Part-Time Employees by Industry).

Consumer credit also increased, partly reflecting a 1.9 percent increase in consumer spending in the United States.

For U.S. parents, the 11.2 percent growth in value added exceeded the growth in capital expenditures (up 1.5 percent) and contrasted with a decrease in employment (down 0.5 percent). Similarly, for all U.S. companies, value added increased 4.5 percent, compared with a 2.1 percent increase in capital expenditures and a 0.6 percent decrease in employment. The increase in U.S. parents' capital expenditures was primarily in retail

trade, in information, and in manufacturing. The increase in manufacturing was led by petroleum-related manufacturing. The decrease in U.S. parents' employment was most pronounced in information, in "other" industries, and in retail trade. The decrease in the information industry was led by telecommunications and data processing, hosting, and related services.

In 2010, U.S. parents' R&D expenditures increased 2.5 percent to \$212.5 billion. Nearly all of the increase was accounted for by three sectors: manufacturing, information, and professional, scientific, and technical

Key Terms

The following key terms are used to describe U.S. multinational companies (MNCs) and their operations.¹

U.S. MNCs

U.S. multinational company (U.S. MNC). The U.S. parent and its foreign affiliates. (In this article, an MNC is usually defined as the U.S. parent and its majority-owned foreign affiliates.)

U.S. parent. A person, resident in the United States, that owns or controls 10 percent or more of the voting securities, or the equivalent, of a foreign business enterprise. "Person" is broadly defined to include any individual, branch, partnership, associated group, association, estate, trust, corporation, or other organization (whether or not organized under the laws of any state), or any government entity. If incorporated, the U.S. parent is the fully consolidated U.S. enterprise consisting of (1) the U.S. corporation whose voting securities are not owned more than 50 percent by another U.S. corporation and (2) proceeding down each ownership chain from that U.S. corporation, any U.S. corporation whose voting securities are more than 50 percent owned by the U.S. corporation above it. A U.S. parent comprises the domestic operations of a U.S. MNC, covering operations in the 50 states, the District of Columbia, the Commonwealth of Puerto Rico, and all other U.S. areas.

U.S. direct investment abroad. The ownership or control, directly or indirectly, by one U.S. person of 10 percent or more of the voting securities of an incorporated foreign business enterprise or the equivalent interest in an unincorporated business enterprise.

Foreign affiliate. A foreign business enterprise in which there is U.S. direct investment, that is, in which a U.S. person owns or controls (directly or indirectly) 10 percent or more of the voting securities or the equivalent. Foreign affiliates comprise the foreign operations of a

U.S. MNC over which the parent is presumed to have a degree of managerial influence.

This article focuses on the operations of majority-owned foreign affiliates; for these affiliates, the combined ownership of all U.S. parents exceeds 50 percent. In 2010, these affiliates accounted for 83.5 percent of the employment of all foreign affiliates of U.S. MNCs.

Measures of operations²

Value added. The portion of the goods and services sold or added to inventory or fixed investment by a firm that reflects the production of the firm itself. It represents the firm's contribution to gross domestic product in its country of residence, which is the value of goods and services produced by labor and property located in that country. Compared with sales, value added is a preferable measure of production because it indicates the extent to which a firm's output results from its own production rather than from production that originates elsewhere. Sales data do not distinguish between these two sources of production. Value added can be measured as gross output minus intermediate inputs; alternatively, it can be measured as the sum of the costs incurred (except for intermediate inputs) and the profits earned in production. The value-added statistics presented in this article were prepared by summing the cost and profits data collected in the annual and benchmark surveys of U.S. direct investment abroad.3

Employment. The number of full-time and part-time employees on the payroll at yearend. If the employment of a parent or an affiliate was unusually high or low because of temporary factors (such as a strike) or large seasonal variation, the number that reflects normal operations or an average for the year was requested of survey respondents.

^{1.} For a comprehensive discussion of the terms and the concepts used, see Raymond J. Mataloni Jr., "A Guide to BEA Statistics on U.S. Multinational Companies," Survey 75 (March 1995): 38–55.

^{2.} Statistics on the operations of U.S. MNCs cover the survey respondent's fiscal year ending in the reference year of the data.

^{3.} For the derivation of the current-dollar value-added statistics, see Raymond J. Mataloni Jr. and Lee Goldberg, "Gross Product of U.S. Multinational Companies, 1977–91," SURVEY 74 (February 1994): 57.

services.

U.S. parents' share of all U.S. companies. U.S. parent companies tend to be large firms that are global leaders in their industries and, therefore, account for a large share of U.S. production. In 2010, U.S. parents accounted for 23.0 percent of value added for all U.S. businesses. They also accounted for significant shares of the tangible and intangible inputs to production. In 2010, they accounted for 42.3 percent of capital expenditures for all U.S. businesses. While U.S. parents accounted for 20.5 percent of U.S. employment of all U.S. businesses, they accounted for a higher share, 25.6 percent, of employee compensation of all U.S. businesses. The higher share of employee compensation may reflect U.S. MNCs' need for a relatively skilled workforce, which leads to higher compensation.¹⁰ The importance of worker skill and innovation to MNCs is evident in U.S. parents' share of R&D expenditures. In 2009, they accounted for 73.4 percent of R&D performed by all U.S. businesses.

Foreign affiliates

The 8.4 percent growth in the value added of foreign affiliates reflected increases in all major industry sectors in 2010 except three: finance and insurance; professional, scientific, and technical services; and

information (table 4). The increases were largest in manufacturing and in mining. Within manufacturing, the increases were largest in "other" manufacturing (led by petroleum-related and paper manufacturing), in computers and electronic products, and in transportation equipment manufacturing.

Growth in foreign affiliates' value added significantly exceeded growth in their employment (up 2.6 percent) and contrasted with a decrease in capital expenditures (down 0.5 percent).

By area, the increase in foreign affiliates' employment was primarily in Asia and Pacific and in Latin America and Other Western Hemisphere. By area, the decrease in capital expenditures was primarily in Europe and in Latin America and Other Western Hemisphere.

In 2010, foreign affiliates' R&D expenditures increased 0.7 percent to \$39.5 billion. The growth in R&D expenditures was concentrated in emerging markets, such as Brazil and India. The growth in emerging markets partly reflected increases in scientific and technological resources—such as institutions, facilities, and personnel—in foreign countries as well as U.S. MNCs' need to be close to rapidly growing markets. Growth in the Middle East, mainly in Israel, was also significant.

Domestic and Foreign Operations of U.S. MNCs Compared

U.S. MNCs maintain a large share of their operations in the United States rather than abroad for many reasons, such as the attraction of a large and prosperous local market, a strong intellectual property protection system, an absence of language barriers and a skilled

⁽D) Suppressed to avoid disclosure of data of individual companies.

^{9.} Intangible inputs to production include any inputs other than raw labor or fixed assets. They include innovation-related intangibles, such as research and development, human resources, such as worker training, and pure organizational intangibles, such as brand names. For details, see Baruch Lev, *Intangibles: Management, Measurement, and Reporting* (Washington, DC: Brookings Institution Press, 2001).

^{10.} For information on the occupational structure of U.S. MNCs, see Elizabeth Weber Handwerker, Mina M. Kim, and Lowell Mason, "Domestic Employment in U.S.-Based Multinational Companies," *Monthly Labor Review* 134 (October 2011): 3–15.

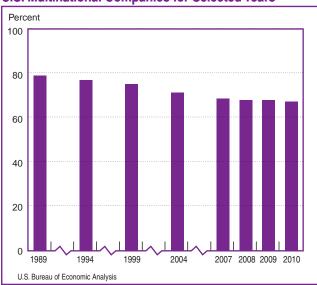

^(*) Less than \$500,000 or 0.05 percent (+/-)

workforce. In 2010, U.S. parents accounted for 69.9 percent of U.S. MNCs' value added, up from 69.4 percent in 2009. Similarly, U.S. parents accounted for a large share of U.S. MNCs' tangible inputs to production: 72.5 percent of capital expenditures and 67.3 percent of employment.

U.S. parents also account for a large share of U.S. MNCs' investment in intangible inputs to production, including R&D expenditures. In 2010, U.S. parents accounted for 84.3 percent of U.S. MNCs' R&D expenditures worldwide, up from 84.1 percent in 2009. U.S. parents' large share partly reflects the following characteristics of the U.S. economy: technology leadership, a highly educated workforce, and effective intellectual property protection. Due to economies of scale in knowledge generation and the United States' strong stance on intellectual property protection relative to other countries, it may be more efficient for U.S. MNCs to concentrate their R&D activities in the United States and then distribute their innovations to their foreign affiliates.

While U.S. parents account for a significant share of U.S. MNCs' worldwide operations, their share has declined between 1999 and 2010.¹¹ U.S. parents' share of U.S. MNCs' value added decreased 8.1 percentage points from 78.1 percent in 1999 to 69.9 percent in 2010. The decrease partly reflects the strong growth in foreign affiliates' value added. Foreign affiliates' value

Chart 2. U.S. Parent Share of Employment by U.S. Multinational Companies for Selected Years

added grew at an average annual rate of 7.2 percent and increased from a 21.9 percent share of U.S. MNCs' value added in 1999 to 30.1 percent in 2010, partly reflecting faster economic growth in large emerging foreign markets than in the United States.

Similarly, U.S. parents' share of U.S. MNCs' tangible inputs to production has declined since 1999, led by employment, which decreased 7.8 percentage points from 75.2 percent in 1999 to 67.3 percent in 2010 (chart 2). The gradual decline in U.S. parents' share of employment primarily reflects the strong growth in foreign affiliates' employment, which grew at an average annual rate of 3.1 percent between 1999 and 2010. The strong growth in foreign affiliates' employment was partly tied to the increasingly important roles that foreign affiliates play in the globalized production arrangements of U.S. MNCs, including facilitating access to foreign markets and serving as support operations for their MNC.

U.S. parents' share of U.S. MNCs' R&D expenditures decreased 3.1 percentage points to 84.3 percent in 2010 from 87.4 percent in 1999. The small size of the change in share over 11 years partly reflects the effects of economies of scale in knowledge generation and the United States' strong stance on intellectual property protection relative to many other countries.

Operations of Foreign Affiliates by Area

While U.S. MNCs tend to have most of their operations in the United States, their success is dependent upon both domestic and foreign markets. Foreign affiliates serve a variety of roles in the global production arrangements of U.S. MNCs. U.S. MNCs overwhelmingly use their affiliates to serve foreign markets. Foreign affiliates also may serve as a low-cost base of production from which to sell to customers both in the United States and in other countries.

In 2010, the value added of foreign affiliates increased 8.4 percent to \$1,241.3 billion. By area, value added increased in all areas except Europe. The increases were most pronounced in Asia and Pacific and in Latin America and Other Western Hemisphere.

In Europe, foreign affiliates' value added was down slightly from the previous year, declining 0.3 percent or \$1.6 billion. In comparison, real gross domestic product for the European Union and the United Kingdom grew by about 2 percent in 2010. 12 By industry, value added decreased across all major industry sectors except mining and manufacturing. The largest decrease

^{11.} For a list of factors that can affect the U.S. parent share of the worldwide operations of U.S. MNCs, see Obie G. Whichard, "Patterns of Production and Employment by U.S. Multinational Companies" (presented at the National Association for Business Economics 2004 Washington Economic Policy Conference, Washington, DC, March 26, 2004): 10; www.bea.gov/papers.

^{12.} Statistics on real GDP growth rates are from the World Bank's World Development Indicators databank. To access the databank on the Web, visit data.worldbank.org/data-catalog and click on "Databank" under "World Development Indicators."

was in finance and insurance, led by foreign affiliates in the United Kingdom and Luxembourg, which may have reflected, among other factors, reduced bond sales as a result of the European sovereign-debt crisis.¹³ In contrast, value added in manufacturing increased, reflecting increases in computers and electronic products and "other" manufacturing. The increase in computers and electronic products manufacturing was largest in Ireland and reflected Ireland's specialization in a number of high-technology-related industries. Employment by European affiliates decreased 1.4 percent, and capital expenditures decreased 8.5 percent.

In Asia and Pacific, foreign affiliates' value added increased 14.8 percent or \$35.8 billion. Almost 80 percent of the increase occurred in mining and in manufacturing. In mining, the increase was led by Other Asia and Pacific, most notably, Papua New Guinea, reflecting high global prices for mineral exports. ¹⁴ In manufacturing, the increase was widespread

throughout the region and was led by "other" manufacturing, primarily petroleum-related manufacturing. These increases were partly offset by a decrease in finance and insurance, primarily in Japan. Employment by affiliates in Asia and Pacific increased 6.7 percent, and capital expenditures increased 9.2 percent.

In Latin America and Other Western Hemisphere, value added increased 24.1 percent or \$30.9 billion. More than 70 percent of the increase was accounted for by finance and insurance and by manufacturing. In finance and insurance, the growth primarily occurred in Bermuda and in the United Kingdom Islands in the Caribbean, partly reflecting reinsurance. In manufacturing, the growth was led by transportation equipment manufacturing, particularly in Mexico and partly reflected the improvement in the U.S. economy and the resulting increase in production and sales of vehicles to the United States. Employment by affiliates in Latin America and Other Western Hemisphere increased 5.3 percent; in contrast, capital expenditures decreased 7.2 percent, led by mining.

In Canada, value added increased 13.2 percent or \$15.0 billion. The largest increase was in manufacturing, led by "other" manufacturing (mainly paper manufacturing and petroleum-related manufacturing). Large increases also occurred in retail trade, in mining, and in professional, scientific, and technical services.

Statistics on U.S. Direct Investment Abroad

BEA collects two broad sets of data on U.S. direct investment abroad: (1) financial and operating data of U.S. multinational companies and (2) international transactions and direct investment position data. This article presents highlights of statistics derived from the first set of data; the statistics derived from the second set of data are usually published in the July and September issues of the Survey of Current Business.¹

Financial and operating statistics. The financial and operating statistics provide a picture of the overall activities of foreign affiliates and U.S. parent companies using a variety of indicators of their financial structure and operations. The statistics on foreign affiliates cover the entire operations of the affiliates, regardless of the share of U.S. ownership. These statistics cover items that are used to analyze the characteristics, performance, and economic impact of multinational companies, such as sales, value added, employment and employee compensation, capital expenditures, goods exports and imports,

and research and development expenditures. Separate statistics are available for all affiliates and for affiliates that are majority-owned by their U.S. parents.

International transactions and direct investment position statistics. The international transactions statistics cover a foreign affiliate's transactions with its U.S. parent, so these statistics relate to the U.S. parent's share, or interest, in its affiliate rather than to the affiliate's size or level of operations. These statistics are key components of the U.S. international transactions accounts (ITAs), the U.S. international investment position, and the national income and product accounts. The major data items are financial flows (recorded in the financial account of the ITAs), which measure the funds that U.S. parents invest in their foreign affiliates, and income (recorded in the current account of the ITAs), which measures the return on those investments.

Direct investment position statistics are stock (cumulative) measures, showing the total outstanding level of U.S. direct investment abroad at yearend. Statistics are provided both at historical cost and at current-period prices. The historical-cost statistics are published by country and by industry.

^{13.} Statistics on net increases in "government securities other than shares" (series A3303) are from the International Monetary Fund (IMF), *International Financial Statistics* (Washington, DC: IMF, June 2012).

^{14.} For more information, see "Minerals in the New Economy" in 2010 Minerals Yearbook, Volume 3, Area Reports: International: Papua New Guinea [Advance Release] (Washington, DC: U.S. Department of the Interior, U.S. Geological Survey, January 2012). Lowe, "Direct Investment for 2009–2011: Detailed Historical-Cost Positions and Related Financial and Income Flows," Survey 92 (September 2012): 28–103.

Employment by Canadian affiliates decreased 0.5 percent, primarily led by a decrease in finance and insurance, while capital expenditures increased 10.1 percent. The increase in capital expenditures partly reflected investments related to the extraction of oil from tar sands.

In Africa, value added increased 23.6 percent or \$10.6 billion. The increase was concentrated in mining (primarily oil and gas extraction) and reflected the rise in petroleum prices. By country, the increases were most pronounced in Nigeria, Angola, and Equatorial Guinea. Employment by African affiliates increased 5.9 percent and capital expenditures increased 2.1 percent.

In the Middle East, value added increased 32.1 percent or \$5.7 billion. The increase was concentrated in mining affiliates (primarily oil and gas extraction) and in manufacturing affiliates. In manufacturing, about 40 percent of the increase in value added was accounted for by affiliates in Israel, particularly affiliates in chemicals and machinery manufacturing. Employment by Middle Eastern affiliates increased 5.7 percent and capital expenditures increased 12.8 percent.

U.S. MNC Operations in Professional, Scientific, and Technical Services

The primary activity of some foreign affiliates of U.S. MNCs is to support the operations of the rest of the MNC. These support activities are largest in low-cost locations with the capacity to provide support services, such as India. By using their foreign affiliates, U.S. MNCs can realize efficiencies and utilize foreign technology centers and human resources to innovate and to maintain a competitive edge. The foreign affiliates involved in professional, scientific, and technical services tend to be in countries that have invested in research facilities and education for workforce devel-

opment. The improvement in information and communication technology has contributed to the growth in support activities performed by foreign affiliates and enhanced communication within the MNC.¹⁵ Many of these foreign affiliates are located in countries that have a physical proximity to the United States or that have a common language or a similar legal structure to the United States and are therefore more conducive to trade with the United States.

Between 1999 and 2010, employment by foreign affiliates in professional, scientific, and technical services increased at an average annual rate of 7.2 percent, which was more than double the 3.1 percent average annual increase in employment for all foreign affiliates (table 5). By industry, 69.8 percent of the employment growth in professional, scientific, and technical services was in computer systems design and related services. India accounted for about half of the employment increase from 1999 to 2010.

Foreign affiliates in low-cost countries may offer high-quality services with lower input costs than the domestically produced alternative, which can be especially beneficial to a company during a period of recession, such as from 2007 to 2009 in the United States. By increasing the provision of some professional, scientific, and technical services functions abroad, the U.S. parent can increase its focus on its core activities, leading to specialization by both the U.S. parent and the foreign affiliates. Furthermore, by growing some operations abroad, U.S. MNCs gain access to foreign

^{15.} See Maria Borga and Jennifer Koncz-Bruner, "Trends in Digitally-Enabled Trade in Services," U.S. Bureau of Economic Analysis (September 2012); www.bea.gov/international/supplemental_statistics.htm.

^{16.} For a more complete discussion of this point, see *Offshoring of Services: An Overview of the Issues*, GAO–06–5 (Washington, DC: U.S. Government Accountability Office (GAO), November 28, 2005); at www.gao.gov/products/GAO-06-5.

markets, leading to increased sales that may be especially beneficial to the company during periods of recession. Between 1999 and 2010, total sales by foreign affiliates in professional, scientific, and technical services grew at an average annual rate of nearly 10 percent. In comparison, total sales for all foreign affiliates grew at an average annual rate of 6.1 percent.

Growth in the operations of foreign affiliates in professional, scientific, and technical services has been particularly strong in India. From 1999 to 2010, value added in India grew at an average annual rate of more than 40 percent, with the majority of the growth occurring after 2004. Factors contributing to this growth include a common language with the United States and favorable changes in the business climate. Since the 1970s, India has liberalized its economy, making it more open to foreign direct investment.¹⁷ Furthermore, the Indian government has increased patent protection rights, instituted several tax incentives to encourage R&D, and established several research and technology centers. In addition, India has a growing skilled workforce whose unit labor costs for certain services are much lower than those in the United States. For example, in 2004–2005, Indian information technology engineers earned a fraction of the annual salary of their U.S. counterparts.¹⁸

In addition to using foreign affiliates to support the operations of other parts of the MNC, U.S. MNCs also use foreign affiliates to deliver services to unaffiliated customers in the United States and abroad. In 2010, foreign affiliates in professional, scientific, and technical services supplied \$140.3 billion in services to unaffiliated customers in U.S. and foreign markets. More than 90 percent of these sales were to unaffiliated persons in the local market of the foreign affiliate. Affiliates in Europe and Japan accounted for more than half of these sales in the local market, particularly for computer systems design and related services.

Selected Aspects of MNC Operations U.S. trade in goods

U.S. MNCs account for a large share of U.S. trade in goods. As global firms, MNCs sometimes export to send final goods to foreign markets or import to bring final goods to the U.S. market. In addition, they sometimes export and import as part of their global produc-

tion processes in which different stages of production are done at home and abroad.¹⁹ In this section, trade between U.S. parents and their foreign affiliates is referred to as intra-MNC trade; trade between U.S. parent companies and foreigners other than their own foreign affiliates and trade between foreign affiliates and U.S. residents other than their own parents is referred to as "MNC trade with others." U.S. MNC-associated trade in goods consists of all U.S. exports and U.S. imports of goods that involve U.S. parents or their foreign affiliates.

In 2010, MNC-associated U.S. exports of goods increased 6.7 percent to \$615.3 billion, and exports of goods by all U.S. businesses increased 21.0 percent to \$1,278.3 billion (table 6 and chart 3). As a result, the

19. For further information, see Maria Borga and William J. Zeile, "International Fragmentation of Production and the Intrafirm Trade of U.S. Multinational Companies," BEA Working Paper WP2004–02 (2004); www.bea.gov/papers/working_papers.htm.

Table 6. U.S. Trade in Goods Associated with U.S. Multinational Companies (MNCs), 2008, 2009, and 2010

[Millions of dollars]

	2008	2009	2010
MNC-associated U.S. exports, total	597,458	576,881	615,345

By MOFAsBy other foreign affiliates 3	4,207	42,330	47,076 n.a.
Addenda:	,	,	
All U.S. exports of goods	1,287,442	1,056,043	1,278,263
total	46.4	54.6	48.1
Intra-U.SMNC exports as a percentage of total	17.7	19.6	18.0
All U.S. imports of goods	2,103,641	1,559,625	1,913,160
totalIntra-U.SMNC imports as a percentage of total	36.6 13.0	46.6 15.0	42.4 13.7

This number is calculated as total exports (imports) between U.S. parents and all of their foreign affiliates (as reported for U.S. parents) less exports (imports) between U.S. parents and MOFAs (as reported for MOFAs).

^{17.} Jakob B. Madsen, Shishir Saxena, and James B. Ang, "The Indian Growth Miracle and Endogenous Growth," *Journal of Development Economics* 93, no. 1 (September 2010): 37–48.

^{18.} See Offshoring: U.S. Semiconductor and Software Industries Increasingly Produce in China and India, GAO–06–423 (Washington, DC: U.S. Government Accountability Office, September 7, 2006): 17, 34. This report is available on the Web at www.gao.gov/products/GAO-06-423.

MOFAs).

2. Pertains to U.S. parents that are, in turn, owned 10 percent or more by a foreign person. The foreign parent group consists of (1) the foreign parent of the U.S. parent, (2) any foreign person, proceeding up the foreign parent's ownership chain, that owns more than 50 percent of the person below it, and (3) any foreign person, proceeding down the ownership chain(s) of each of these members, that is owned more than 50 percent by the person above it.

^{3.} This number is calculated as total exports (imports) associated with other (that is, minority-owned and 50-percent owned) foreign affiliates (as reported for affiliates) less the estimate of exports (imports) between U.S. parents and other foreign affiliates that are calculated as described in footnote 1. However, these estimates may be imprecise because of differences in the coverage of the data reported for U.S. parents and for foreign affiliates. No estimates for 2010 and 2008 (exports) can be made because the differences were especially large in the coverage.

MOFA Majority-owned foreign affiliate n.a. Not av

MNC-associated share of total U.S. exports of goods decreased, falling to 48.1 percent in 2010 from 54.6 percent in 2009 and 46.4 percent in 2008. The rise and subsequent fall in the U.S. MNC share suggests that U.S. MNC-associated trade, particularly intra-MNC trade, is less sensitive to cyclical economic fluctuations than unaffiliated trade. The increase in MNC-associated exports of goods reflected increases in both intra-MNC trade and "MNC trade with others." Intra-MNC exports increased 10.7 percent to \$229.7 billion, while MNC exports to others increased 4.4 percent to \$385.7 billion.

In 2010, MNC-associated U.S. imports of goods increased 11.6 percent to \$810.5 billion, and imports of goods by all U.S. businesses increased 22.7 percent to \$1,913.2 billion. As a result, the MNC-associated share of total U.S. imports of goods fell to 42.4 percent in 2010 from 46.6 percent in 2009 and 36.6 percent in 2008. Imports in petroleum-related manufacturing were a significant contributor to MNC imports; they increased more than 25 percent in 2010 and accounted for more than 10 percent of the 2010 increase in total U.S. imports of goods. The increase in MNC-associated imports of goods reflected increases in both intra-MNC trade and "MNC trade with others." Intra-MNC imports increased 12.5 percent to \$262.7 billion, and MNC imports from others increased 11.2 percent to \$547.8 billion.

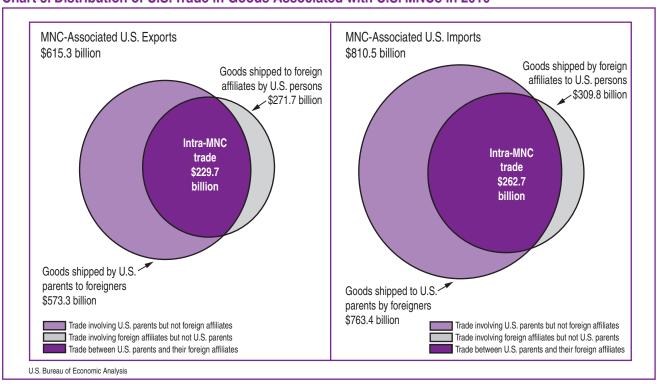

Research and development

U.S. MNCs conduct research and development (R&D) to generate innovations in their products and processes to raise their productivity and to expand the global scope of their operations.²⁰ R&D expenditures of U.S. MNCs increased 2.2 percent to \$252.0 billion in 2010 from \$246.5 billion in 2009 (table 2).

In 2010, R&D expenditures by U.S. parents increased 2.5 percent to \$212.5 billion from \$207.3 billion in 2009 (table 3). By industry, R&D expenditures by U.S. parents were concentrated in three industry sectors—manufacturing (\$161.2 billion), information (\$22.2 billion), and professional, scientific, and technical services (\$17.6 billion).

R&D expenditures of foreign affiliates increased 0.7 percent to \$39.5 billion in 2010, up from \$39.2 billion in 2009 (table 4). Over the last decade, R&D performed by foreign affiliates grew faster than R&D performed by U.S. parents; the faster growth partly reflects increases in scientific and technological resources in foreign countries, such as expanded and improved technical education, and MNCs' need for locally designed products for large emerging foreign

Chart 3. Distribution of U.S. Trade in Goods Associated with U.S. MNCs in 2010

^{20.} See Stephen R. Yeaple, "Firm Heterogeneity and the Structure of U.S. Multinational Activity: An Empirical Analysis," *Journal of International Economics* 78, no. 2 (July 2009): 206–215 and Elhanan Helpman, Marc J. Melitz and Stephen R. Yeaple, "Export versus FDI with Heterogeneous Firms," *American Economic Review* 94, no. 1 (March 2004): 300–316.

markets, such as Brazil, China, and India. More than 60 percent of R&D expenditures were accounted for by Europe, where R&D expenditures were concentrated in a small number of technologically advanced host countries, including Germany and the United Kingdom

In Asia and Pacific, R&D expenditures of foreign affiliates increased 6.2 percent to \$8.3 billion in 2010; more than half of the increase was accounted for by India. R&D expenditures in India increased 19.4 percent to \$1.6 billion.

In Latin America and Other Western Hemisphere, R&D expenditures of foreign affiliates increased 33.0 percent to \$1.9 billion in 2010, mainly in Brazil. In Brazil, the increase in R&D expenditures was led by transportation equipment manufacturing. The increase in transportation equipment manufacturing R&D expenditures partly reflected companies' efforts to develop and improve flexible fuel vehicles, which accounted for more than 90 percent of all new cars and light vehicles sold in Brazil.²¹

Additional detail on R&D by U.S. MNCs. Beginning with data for 2004, BEA, the National Science Foundation (NSF), and the U.S. Census Bureau, which conducts an R&D survey on behalf of NSF, have been conducting a project linking data from BEA and NSF surveys to provide a more complete picture of R&D associated with U.S. and foreign MNCs. An NSF *Info-Brief* summarizing the initial results of the link, covering 2004–2007, was released in September.²² That

publication provides summary data on the types of R&D conducted by MNCs (basic research, applied research, and development). Additional details, including the location by state of R&D conducted in the United States, are presented in an associated NSF publication.²³

Real value added in manufacturing

In addition to the current-dollar estimates of value added of foreign affiliates, BEA prepares estimates of real value added of foreign affiliates in manufacturing. These estimates, which remove the effects of changes in prices and exchange rates, provide meaningful comparisons of value added for foreign affiliates across countries and over time. Comparisons across countries are improved because the estimates in real terms are based on purchasing power parity (PPP) exchange rates rather than on market exchange rates.²⁴ Comparisons over time are improved because the estimates are denominated in chained (2005) dollars that account for both changes in prices and changes in the industry mix of production by manufacturing affiliates. The

Revisions

The statistics on MNC operations in 2010 are preliminary. The employment and sales statistics replace the advance summary statistics that were issued in the BEA news release "Summary Estimates for Multinational Companies: Employment, Sales, and Capital Expenditures for 2010" on April 18, 2012. From the advance to the preliminary statistics, employment was revised down 0.3 percent, and sales were revised down 0.7 percent.

The final statistics on MNC operations in 2009 are also presented. The final statistics on employment and sales replace the advance summary statistics in the April 18, 2012 news release and the preliminary statistics that were published in the November 2011 Survey of Current Business article, "Operations of U.S. Multinational Compa-

nies in the United States and Abroad: Preliminary Results From the 2009 Benchmark Survey." From the advance statistics to the final statistics, employment was revised down 0.2 percent, and sales were revised down 0.1 percent. From the preliminary statistics to the final statistics, employment was revised down 0.6 percent, and sales were revised down 0.4 percent.

In addition to the statistics on the levels of U.S. MNC employment and sales, the April 18, 2012, news release included the 2009 to 2010 growth rates. These growth rates were revised as a result of the revisions to the levels of the 2009 and 2010 statistics; employment growth was revised down less than 0.1 percent, and sales growth was revised down 0.6 percent.

^{23.} Francisco Moris, "International Investment and R&D Data Link: 2004–2007," National Science Foundation: Detailed Statistical Tables NSF 12–327 (September 2012); www.nsf.gov/statistics/nsf12327.

^{24.} To translate the value-added estimates that are denominated in foreign currencies into U.S. dollars for international comparisons, PPP exchange rates generally are preferable because they approximate the number of foreign currency units required in a foreign country to buy the goods and services that are equivalent to those that can be bought in the United States with one U.S. dollar. A distinguishing feature of PPP exchange rates is that they are based on the prices of all goods and services produced or sold in a country, both those that are traded internationally and those that are not. For details about the original methodology used to derive the estimates of real value added, see Raymond J. Mataloni Jr., "Real Gross Product of U.S. Companies' Majority-Owned Foreign Affiliates in Manufacturing," Survey 77 (April 1997): 8–17. The original methodology was significantly improved in 2006 when the industry detail of the producer price indexes used for deflation was increased from 6 manufacturing industries to 22 manufacturing industries.

real value-added estimates are available only for manufacturing because the required source data are not available for other industries.

The real value added of foreign affiliates in manufacturing increased 6.7 percent to \$481.0 billion in 2010 (table 7). The 29 countries for which estimates are separately available accounted for 76.5 percent of the total value added of foreign affiliates in manufacturing. The real value added of manufacturing affiliates in these countries increased 2.4 percent to \$368.1 billion, while total manufacturing production in these countries increased 7.3 percent (chart 4). The real value-added increases in manufacturing reflected increases in Ireland, Canada, and China. In Ireland, real value added of foreign affiliates increased \$5.9 billion to \$30.7 billion; changes in the current-dollar valueadded estimates suggest that this increase was mainly in computers and electronic products manufacturing. In Canada, real value added increased \$5.1 billion to \$43.0 billion, primarily in paper and petroleum-related manufacturing. In China, real value added increased \$3.1 billion to \$42.7 billion, reflecting increases

Chart 4. Real Value Added of MOFAs in Manufacturing and Industrial Production in 29 Selected Countries, 1999–2010

MOFA Majority-owned foreign affiliate

Note. The 29 selected countries are Australia, Austria, Bulgaria, Canada, China, the Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Japan, Lithuania, Mexico, the Netherlands, Norway, Poland, Portugal, Singapore, the Slovak Republic, Slovenia, South Korea, Spain, Sweden, Switzerland, and the United Kingdom. The composite index of host-country industrial production was derived by weighting each country's index by the country's share in the dollar value of real value added of MOFAs in manufacturing

^{*} Less than \$500,000

the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Because the formula for the chain-type quantity indexes uses weights of more than one period,

in all major manufacturing groups except computers and electronic products and electrical equipment, appliances, and components. Overall, China's share of real value added in 2010 was the 4th highest of the 29 selected countries after the United Kingdom, Germany, and Canada, up from the 12th highest in 1999.

The real value added of foreign affiliates in all other countries increased 21.5 percent to \$113.5 billion. Based on the current-dollar value-added estimates and the market-exchange-rate-based estimates, the increase was led by affiliates in Latin America and Other Western Hemisphere.

Conclusion

Each year, the Bureau of Economic Analysis conducts a survey of the operations of U.S. parent companies and their foreign affiliates. The most recent results show that the production of goods and services of U.S. MNCs, as measured by value added, grew in 2010, reflecting renewed economic growth in the United States and in many foreign host countries. Growth in production at home was widespread by industry, but it was most rapid in petroleum-related industries and in finance. Growth in production abroad was widespread by area, except Europe, but it was most rapid in less developed countries, particularly in big emerging markets such as Brazil, China, and India.

Data Availability

The final statistics on the worldwide operations of U.S. multinational companies (MNCs) for 2009 and the preliminary statistics for 2010 are presented in this article. The statistics are based on the 2009 benchmark survey and the 2010 annual survey of U.S. direct investment abroad. More detailed statistics are available on BEA's Web site.

The final statistics on the operations of U.S. MNCs for 1977 and for 1982–2009 are available in publications or in data files that can be downloaded free of charge from the BEA Web site at www.bea.gov. For more information about these products and how to obtain them, go to www.bea.gov, click on "International," and under "Direct Investment and Multinational Companies," click on "International Economics Directorate Product Guide." The statistics are available under "Operations of U.S. Parent Companies and their Foreign Affiliates."

BEA has a free service on its Web site that allows users to interactively access detailed statistics on the operations of U.S. multinational companies, on the operations of foreign-owned companies in the United States, and on other aspects of U.S. direct investment abroad and foreign direct investment in the United States. For an introductory guide to this service, see Ned G. Howenstine, "Primer: Accessing BEA Direct Investment Data Interactively," Survey of Current Business 86 (May 2006): 61–64.

removed (and included in ther services supplied measure) plus the portion of premiums set aside for the settlement of expected or "normal" losses. For banks, "other" consists of the investment income remaining after BEA's estimate of the value of implicit services provided by banks is excluded (and included in services supplied). In industries other than finance and insurance, investment income is generally considered to be an incidental revenue source; this income is included in the income statement in a separate "other income" category, but is not included in sales or in this column.

^{*}Less than \$500,000 (+/-).

D Suppressed to avoid disclosure of data of individual companies.

1. "Other" consists largely of investment income that is included in "sales or gross operating revenues" in the income statement. In finance and insurance, investment income is included in sales because it is generated by a primary activity of the company. For insurance, "other" consists of investment income remaining after BEA's estimate of investment income earned on funds insurers hold on behalf of policyholders is

removed (and included in ther services supplied measure) plus the portion of premiums set aside for the settlement of expected or "normal" losses. For banks, "other" consists of the investment income remaining after BEA's estimate of the value of implicit services provided by banks is excluded (and included in services supplied). In industries other than finance and insurance, investment income is generally considered to be an incidental revenue source; this income is included in the income statement in a separate "other income" category, but is not included in sales or in this column.

^{*}Less than \$500,000 (+/-).

D Suppressed to avoid disclosure of data of individual companies.

1. "Other" consists largely of investment income that is included in "sales or gross operating revenues" in the income statement. In finance and insurance, investment income is included in sales because it is generated by a primary activity of the company. For insurance, "other" consists of investment income remaining after BEA's estimate of investment income earned on funds insurers hold on behalf of policyholders is

*Less than \$500,000 (+/-).

D Suppressed to avoid disclosure of data of individual companies.
1. "Other" consists largely of investment income that is included in "sales or gross operating revenues" in the income statement. In finance and insurance, investment income is included in sales because it is generated by a primary activity of the company. For insurance, "other" consists of investment income remaining after BEA's estimate of investment income aread on funds insurers hold on behalf of policyholders is removed (and included in ther services supplied measure) plus the portion of premiums set aside for the settlement of expected or "normal" losses. For banks, "other" consists of the investment income remaining after BEA's estimate of the value of implicit services provided by banks is

excluded (and included in services supplied). In industries other than finance and insurance, investment income is generally considered to be an incidental revenue source; this income is included in the income statement in a separate "other income" category, but is not included in sales or in this column.

2. The European Union (27) comprises Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, and the United Kingdom.

3. OPEC is the Organization of Petroleum Exporting Countries. In 2009, its members were Algeria, Angola, Ecuador, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela.

excluded (and included in services supplied). In industries other than finance and insurance, investment income is generally considered to be an incidental revenue source; this income is included in the income statement in a separate "other income" category, but is not included in sales or in this column.

2. The European Union (27) comprises Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, and the United Kingdom.

3. OPEC is the Organization of Petroleum Exporting Countries. In 2010, its members were Algeria, Angola, Ecuador, Iran, Iraq, Kuwait, Libya, Nigeria, Qatar, Saudi Arabia, the United Arab Emirates, and Venezuela.

^{*}Less than \$500,000 (+/-).

D Suppressed to avoid disclosure of data of individual companies.

1. "Other" consists largely of investment income that is included in "sales or gross operating revenues" in the income statement. In finance and insurance, investment income is included in sales because it is generated by a primary activity of the company. For insurance, "other" consists of investment income remaining after BEA's estimate of investment income earned on funds insurers hold on behalf of policyholders is removed (and included in ther services supplied measure) plus the portion of premiums set aside for the settlement of expected or "normal" losses. For banks, "other" consists of the investment income remaining after BEA's estimate of the value of implicit services provided by banks is

An Analysis of Revisions to BEA's International Economic Accounts

By Daniel R. Yorgason and Sarah P. Scott

Executive Summary

This article examines the accuracy of the international accounts estimates of the Bureau of Economic Analysis (BEA), primarily through an analysis of revisions to early vintage, or the first published, account estimates. While these estimates are published before full or final information regarding an account is available, BEA endeavors to ensure that these estimates are sufficiently timely and accurate to be used confidently as the basis of economic policy and business decisions. The size and pattern of revisions—that is, the difference between early estimates and later estimates, which incorporate more up-to-date concepts and statistical methods and more complete and accurate source data—provide a measure of the accuracy of the initial estimates. In this article, BEA's standard of accuracy hinges on these revisions; the standard of accuracy is met if the revisions do not substantively change BEA's measures of behavior and trends in key aggregates.

BEA's quarterly international transactions accounts (ITAs) are the primary focus of this study. Among BEA's international economic accounts, the ITAs provide the broadest picture of interactions between the United States and the rest of the world. The importance of these interactions has been increasing in recent decades as the U.S. economy becomes increasingly "globalized." The ITAs and the other international economic accounts provide policymakers, scholars, and the public with the most complete and detailed information on the nature and scope of these interactions. If BEA's standard of accuracy is met, policymakers and other users of these accounts will be able to rely on BEA's early estimates as accurate indicators of the state of the economy; policies will not necessarily need to be reconsidered in light of revisions to the accounts.

Major findings

Based on the analysis of revisions to the 1999–2011 quarterly ITA estimates, BEA's estimates do provide a

Alexis N. Chaves contributed some calculations used in the preparation of this article. consistent and accurate picture of economic activity between U.S. residents and foreigners. Early estimates, which are available approximately 75 days after the end of the quarter, closely track later estimates, particularly for key aggregates. Revisions are small relative to the estimates themselves or relative to quarter-to-quarter variability in the estimates. Revisions rarely change the direction of movement in the accounts.

Notwithstanding the strong overall performance of the ITA estimates, revisions of some accounts are larger than those of others. Among accounts with the largest revisions are income receipts and payments, particularly those related to direct investment. Among the other specific findings of this study are the following:

- More than 95 percent of first estimates of the currentaccount balance show the same direction of change as third estimates. First estimates also correctly identify 95 percent of third-estimate turning points.
- The component account making the largest contribution to quarter-to-quarter changes of major aggregates is the same for both first and third estimates in at least 75 percent of the estimates for each major aggregate.
- Revisions in the current account to quarterly estimates of exports of goods and services and to imports of goods and services are particularly small, at less than 1 percent of account value.
- The average revision to the current-account balance, relative to the sum of the credits and debits contributing to the balance, is less than one-half of 1 percent. For goods trade, whose sum of credits and debits constitutes approximately 60 percent of all credits and debits in the current account, the average revision of the balance is smaller still.
- The average revision to the current-account balance is less than 50 percent of the quarterly variability of the current-account balance.
- Revisions in the financial account are larger in dollar terms than those in the current account but are of similar magnitude relative to the quarterly variability of both of these accounts and of smaller magnitude relative to comparably scaled revisions in GDP.

• The range of revisions for international accounts outside the ITAs (the international investment position accounts and items from surveys of the operations of multinational companies) is similar, on a relative basis, to the range of current-account revisions in the ITAs. These accounts are annual accounts and, depending on account, are published approximately 6 months to 23 months after the end of the reference year.

Approach of study

The article primarily examines the size and pattern of revisions to quarterly estimates of the ITAs from 1999 onward. The two main measures examined are mean revisions, which indicate whether the revisions are generally upward or downward, and mean absolute revisions, which indicate the average size of the revisions regardless of sign. Both means are based on revisions that have been scaled to enable comparisons over time, given that the ITA estimates are reported in current dollars and to enable comparison of revisions across accounts. Four scaling methods are used:

- Scaling by item value is the most intuitive scaling measure because it expresses revisions as percentages; it is used for revisions of current-account components.
- •Scaling by the sum of unsigned components is a variation on scaling by item value that is well suited for revisions of net accounts, such as balances in the current account. Under this method, the trade balance, for example, is scaled by the sum of exports and imports.
- Scaling by trend quarter-to-quarter changes compares revisions to account changes rather than to account levels. This method is applied to more complex accounts—namely, net accounts for which available component detail is incomplete—such as those in the financial account.
- •Scaling by trend gross domestic product, which allows for comparisons of dollar revisions across accounts while adjusting for economic growth and inflation.

In addition to analyzing mean revisions and mean absolute revisions of the accounts, the study examines the consistency across estimate vintages of qualitative patterns of change (turning points, acceleration/deceleration, and component account contributions to changes in an aggregate), trends in revisions, the impact of revisions to seasonal adjustment factors, and the correlation of same date revisions of different reference quarters' estimates.

The article secondarily examines mean revisions and mean absolute revisions for annual estimates from 1989 onward of two other types of international economic accounts: the international investment position accounts and the activities of multinational companies.

I. Introduction

The mission of the Bureau of Economic Analysis (BEA) is, in part, to promote "a better understanding of the U.S. economy by providing the most timely, relevant, and accurate economic accounts data."1 For most of its accounts, BEA produces several vintages of any given estimate. Early vintage estimates are necessarily more provisional and based on less complete source data than later vintage estimates. In spite of a largely unavoidable tradeoff between timeliness and accuracy, BEA strives to present a consistent and accurate picture of economic patterns and trends even in its early estimates so that economic policy and business decisionmakers can be confident in the factual basis for their decisions. This article presents measures to assess BEA's success in this effort for its international economic accounts estimates.

The international economic accounts published by BEA provide a broad and detailed look at transactions between U.S. residents and foreign residents and at other economic links between the United States and the rest of the world. These accounts contribute to and provide important context for BEA's national income and product accounts (NIPAs), including the statistics on gross domestic product (GDP). BEA regularly publishes articles in this journal analyzing its revisions to estimates of GDP and other NIPAs, and it recently published an article analyzing revisions to its estimates of state personal income, one of its regional economic accounts.² This article assesses the accuracy of the international economic accounts primarily by comprehensively analyzing revisions to these accounts.³

The U.S. international transactions accounts (ITAs) are an important and highly visible subset of BEA's international economic accounts.⁴ The ITAs are a quarterly and annual record of transactions between U.S. residents and the rest of the world, including trade in goods and services, income payments and receipts, and

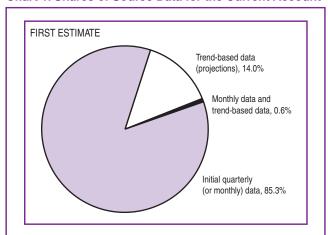

^{1.} See BEA's mission statement at www.bea.gov/about/mission.htm.

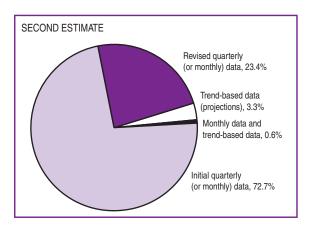

^{2.} For the most recent analysis of the revisions of GDP and related accounts, see Dennis J. Fixler, Ryan Greenaway-McGrevy, and Bruce T. Grimm, "Revisions to GDP, GDI, and Their Major Components," SURVEY OF CURRENT BUSINESS 91 (July 2011): 9–31. That article contains references to several other articles and studies on GDP and associated revisions. For the analysis of revisions to BEA's regional accounts, see Matthew A. von Kerczek and B. Enrique Lopez, "An Examination of Revisions to the Quarterly Estimates of State Personal Income," SURVEY 92 (August 2012): 243–266.

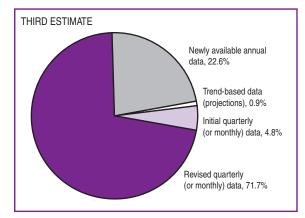

^{3.} BEA periodically reports to the Office of Management and Budget on revisions to a limited set of international accounts statistics. This article extends those reports in several directions.

^{4.} Another term by which the ITAs are known is the "balance of payments"

Chart 1. Shares of Source Data for the Current Account

Note. Calculations are made for the gross sum of exports of goods and services and income receipts and imports of goods and services and income payments. The calculions excludes net unilateral current transfers, which as a net account, has a total that does not fully reflect the magnitude of the source data contributions.

U.S. Bureau of Economic Analysis

flows of financial and capital assets. They consist of 12 tables. Table 1 of the ITAs is entitled "U.S. International Transactions." It provides an overview of all transactions in the ITAs. ITA tables 2–12 provide more detail for various subsets of transactions. This article places particular emphasis on assessing revisions to the

seasonally adjusted aggregate estimates that BEA releases quarterly in table 1 of the ITAs. The data periods primarily analyzed in examining the ITA estimates are the quarters of 1999-2011.⁵

In addition to the ITAs, the article examines revisions to the estimates of the international investment position (IIP) accounts—accounts that record end-of-year positions for U.S.-owned assets abroad and for foreign-owned assets in the United States. The article also examines revisions to estimates of the activities of U.S. multinational companies (MNCs) and U.S. affiliates of foreign MNCs with operations in the United States.⁶

In this article, revisions are analyzed in order to evaluate the accuracy of the international economic accounts estimates. A standard approach to assessing estimate accuracy is to analyze the errors associated with the estimation process. In general, however, the source data used to produce the international economic accounts estimates are subject to a complex mix of sampling and nonsampling errors.

Typically, these source data are provisional, incomplete, or unavailable at the time of BEA's initial published estimates, that is, the "first" estimate. The reliance on source data with such limitations reflects the importance of providing estimates that are sufficiently timely to be useful to policymakers and economic and business analysts. In the current account, approximately 15 percent of initial estimates are based on extrapolation of trends or on indicator series rather than on actual, contemporaneous source data (chart 1). In addition, although almost all of the remainder of the initial estimates are based on survey or administrative data, those data are often provisional and subject to change as reporting response rates improve, data editing becomes more complete, and data from monthly or quarterly surveys are supplemented by, or replaced with, data from annual surveys, which tend to collect data more extensively as well as have larger samples and more thorough editing.

After the first estimate is published, estimates are revised at set intervals to incorporate more current source data and to integrate other estimation changes. Revisions are made to the source data as previously missing information becomes available and as previously incorporated source data are revised. By the "annual revision" that occurs the following June, only about 1 percent of estimates are trend based; 94 percent are

^{5.} The availability of ITA table 1 data in electronic form is the reason for focusing on the 1999–2011 time period.

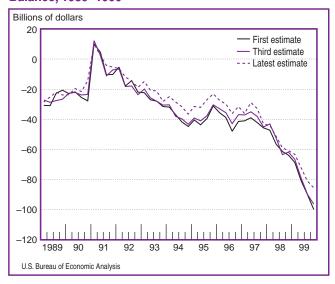

^{6.} The full set of U.S. international accounts includes other accounts whose revisions are not examined in this article, such as monthly estimates of trade in goods and services, a joint product of BEA and the U.S. Census Bureau.

based on revised source data or on newly available annual data. BEA also makes other changes to its later vintage estimates, including occasional changes in classifications, definitions, and methodologies, to reflect the changing nature of available economic data and the changing nature of the economy itself.

The combination of circumstances just described makes measuring the accuracy of the BEA's international economic accounts estimates a challenge. The mix of source data errors, regular revisions, and occasional changes in definitions and methodologies means that the accuracy of BEA's estimates cannot be assessed by conventional statistical measures, such as standard errors. Information on the accuracy of early vintage estimates can, however, be garnered by examining magnitudes and patterns of differences between different vintages of the same estimate. This article assesses the accuracy of BEA's early estimates primarily by assessing the size and direction of revisions. In general, the smaller the revisions to key aggregates, balances, and other accounts, the more the early estimates present an accurate picture of trends and levels in transactions as well as expansions or contractions of U.S. participation in the international economy. Another way the accuracy of estimates is assessed is by the frequency with which early estimates capture turning points in the accounts—that is, quarters in which a previously increasing series turns downward or vice versa.

While an analysis of revisions provides information on early estimate accuracy, that information is not necessarily definitive. Estimates can be revised for a number of different reasons, with different implications for the accuracy and quality of the earlier estimates. Revisions that result from changes in definition

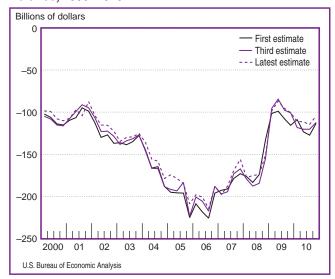

Chart 2. Three Vintages of Estimates of Current-Account Balance, 1989–1999

may not have many implications for estimate quality. When the target changes, a change in the estimate does not necessarily mean that the earlier estimate, which had a different target, was flawed or that future estimates will be undependable. Implications for estimate quality are less clear with regard to revisions stemming from the introduction of new methodologies or new sources of (source) data. Revisions of these types may suggest some deficiencies in early vintage estimates released in the past but do not necessarily portend any problems for future early vintage estimates. Finally, small revisions resulting from ongoing updates to source data suggest that early vintage estimates may be considered accurate. As demonstrated throughout this article, the magnitudes of revisions and behavior of the major components of the international accounts compiled by BEA indicate that early estimates present the same general picture of economic activity as later estimates. Charts 2 and 3, which look at the current-account balance, one of the most closely watched summary estimates in the ITAs, provide some initial evidence. These charts compare the first estimates to the third estimates, which are released in June of the year after the reference year, and to the latest available estimates.7

The charts show that although the quarterly estimates for the current-account balance differ slightly in

Chart 3. Three Vintages of Estimates of Current-Account Balance, 2000–2010

^{7.} Of the three estimate vintages shown in the charts, only one—the latest vintage—constitutes a data series published by BEA. The published data series includes the first estimate for the most recent quarter, second estimates for earlier quarters in the same year, third estimates for quarters of the prior year, and fourth and later estimates for earlier years. (This sequencing is discussed at greater length later on page 81.) The first estimate "series" in the charts is an amalgam that extracts a single quarter's estimate from every data release over the period at issue.

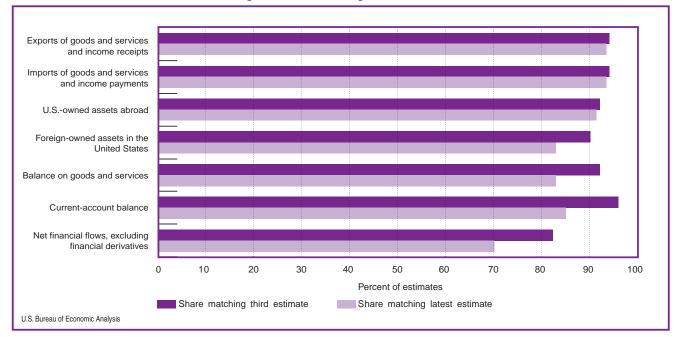

Chart 4. Share of First Estimates Matching Direction of Change of Later Estimates, 1999–2011

the three estimate vintages, all three capture the key trends and patterns in the current-account balance. For example, each vintage shows that in the first and second quarter of 1991, the balance briefly moved into surplus after being in deficit for the 2 previous years, only to fall back into deficit in the third quarter. Each vintage also shows the deficit increasing sharply starting in the first quarter of 1998 and again in the second quarter of 1999. Similarly, each vintage shows a temporary bottoming out of the deficit in 2000, a slight rebound through the second half of 2001, followed by further off-and-on increases of the deficit through 2005. Each shows a moderate reduction in the deficit through the middle of 2008 and a sharp reduction through the second quarter of 2009.

These charts also show that revisions in the current-account balance are also smaller than the quarterly variability of the estimates. Over the period, the average magnitude of revision between the first estimate and the third estimate is \$5.3 billion, 61 percent of the average quarterly change of \$8.8 billion. The differences between the first estimates and the latest estimates are typically larger than those between the first and third estimates, reflecting in part the impact of changes in definition and methodologies that have been introduced over the years.

Chart 4 provides further evidence that early estimates present the same general picture of economic activity as later estimates. This chart provides directional accuracy measures for some key ITA accounts. Specifically, it displays relative frequency measures of the fidelity of first estimates to later estimates in terms of the direction of movement in the estimates' time series. The bars in the chart indicate how frequently the first ITA estimates show the same direction of change as the third estimates. If the first estimate and the later estimate both indicate a quarter-to-quarter increase in the account, or if both estimates indicate a quarter-toquarter decrease, the two different vintages "match" directionally. If one estimate indicates a quarter-toquarter increase while the other indicates a quarter-toquarter decrease, the vintages do not match. For all but one of the aggregates shown in the chart, more than 90 percent of first estimates imply movement in the same direction as implied by the third estimates.

The remainder of the article presents a variety of other measures for gauging whether BEA's early vintage estimates accurately reflect its later vintage estimates. This issue is evaluated using a variety of statistical measures, including mean revisions and mean absolute revisions. Four versions of mean (scaled) revisions and mean absolute (scaled) revisions are used:

• Scaling by item value is the most intuitive of the scaling measures. It allows for an "apples-to-apples" comparison across time and accounts of the magnitude of revisions. It is used for revisions of current-account components.

^{8.} Absolute values of both revisions and quarterly changes are used in computing these averages. A later section of the article develops an alternative method for comparing revisions to quarterly changes. The alternative method is preferred because it accounts for economic growth and inflation. With the alternative method, current-account revisions average less than 50 percent of quarterly changes.

- Scaling by the sum of unsigned components is a variation on scaling by item value; for "simple" accounts—those that simply aggregate transactions—the two methods produce identical results. Scaling by the sum of unsigned components is well suited for scaling revisions of accounts formed as the difference, rather than the sum, of two other simple accounts. It is used in this study for current-account balances.
- •Scaling by trend quarter-to-quarter changes compares revisions to account changes rather than to account levels. This serves to some extent to correct for the difficulty associated with estimating highly volatile accounts. It is used for accounts—such as those in the financial account—that are even more complex than those in the current account.
- Scaling by trend gross domestic product is a method that does not provide an "apples-to-apples" comparison of accuracy in terms of item levels or changes across accounts. Rather, it allows for the dollar value of revisions to be compared across accounts while adjusting for economic growth and inflation.

Section II of the article provides information on the international accounts estimates examined in this article, focusing on data sources and the timing of the various estimate vintages. Section III presents the methodology used in the study, including revision definitions and the construction of different scaling methods. This section also discusses why the different scaling methods are used for different types of accounts. Section IV revisits the issue of directional matching at greater depth and examines which component account is the largest contributor to a quarterly increase or decrease in an aggregate estimate. Section V considers mean revisions and mean absolute revisions of the ITA estimates. Section VI analyzes other issues related to ITA revisions. Section VII examines revisions of non-ITA estimates. Finally, section VIII summarizes the findings of the article.

II. Sources, Timing, and Vintages of International Economic Accounts Estimates

This section provides an overview of some key international economic accounts. While the primary focus is on the ITAs, the international investment position accounts and estimates of activities of multinational companies are also briefly discussed. Topics include source data, estimate timing, and the estimate vintage nomenclature used later in the article. The issues of source data and estimate vintages are interrelated; the source data used for an early estimate may differ from

those used for later estimates. In addition, for certain estimates, little or no source data are available at the time the first estimate is produced.

Quarterly ITA estimates

The ITAs are a comprehensive record of U.S. international transactions—that is, transactions between U.S. residents and foreign residents. They are divided into three major categories: the current account, the capital account, and the financial account. Broadly, the current account measures those international transactions most closely associated with current production, consumption, and income, including trade in goods and services. The capital account measures transactions that result in changes to the stock of nonproduced nonfinancial assets, such as the purchase or sale of rights to natural resources, or that are considered capital transfers, such as debt forgiveness. The financial account measures international transactions in financial assets and liabilities, such as transactions in U.S. and foreign stocks and bonds.9 Of the three, current-account transactions and financial-account transactions are much larger in value than capital-account transactions.

BEA draws upon data from a variety of sources to produce estimates for the ITAs. Table 1 provides a list of several of the largest types of accounts in the ITAs and the sources used to produce estimates in those accounts. By value, roughly one-fifth to one-fourth of later-vintage ITA estimates are based on surveys conducted by BEA. In particular, estimates of direct investment income and financial flows and estimates of several types of trade in services are based on BEA surveys. The remainder of the estimates are based on surveys conducted by other federal agencies and on a wide range of survey and nonsurvey data from other government and private sources. Among the non-BEA sources of data are administrative filings compiled by agencies, such as the U.S. Census Bureau (used, for example, for

^{9.} A fourth ITA "category" is the statistical discrepancy. It is defined as the amount that balances the sum of recorded credits and debits across all of the accounts in the ITAs. It can be computed as the reversed-sign sum of net financial flows and the combined balance of the current and capital accounts. For a more complete description of the current account, capital account, financial account, and statistical discrepancy, see Christopher L. Bach, "A Guide to the U.S. International Transactions Accounts and the U.S. International Investment Position Accounts," SURVEY 90 (February 2010): 33–51 and U.S. International Transactions Accounts: Concepts and Estimation Methods (Washington, DC: Bureau of Economic Analysis, June 2011).

^{10.} See Christopher L. Bach, *U.S. International Transactions Accounts: Concepts and Estimation Methods* (Washington, DC: Bureau of Economic Analysis, June 2011) for more information on source data.

^{11.} These surveys are mandatory for respondents. BEA also conducts a relatively small voluntary survey on institutional remittances. These data are used in producing estimates of net unilateral current transfers, an account not shown in table 1.

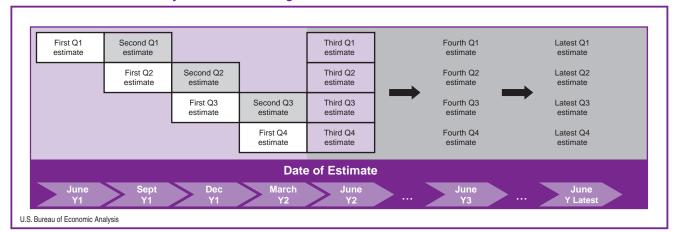

Chart 5. Timeline of Quarterly ITA Estimate Vintages

the goods trade accounts) and the Federal Reserve Board (used, for example, for the financial-account transactions reported by nonbanks), and mandatory surveys conducted by other government agencies, such as the U.S. Treasury Department (used, for example, for "other" private investment income accounts and much of the financial account). Certain data are also obtained from foreign sources including Statistics Canada and several foreign central banks.

The remaining columns in table 1 briefly characterize the extent to which source data are available (or not) and revised for each of several estimate vintages. The evolution of ITA estimate vintages is shown in chart 5. BEA prepares an ongoing series of estimates for the transactions covered by the ITAs; each supersedes the most recent previous estimate. For every one of the accounts in the ITAs, an initial estimate—the "first" estimate—is released approximately 75 days after the end of the reference quarter. First estimates include projections for accounts for which source data are not yet available. For instance, first estimates of royalties and license fees received and paid are based on projections, as data from BEA's quarterly survey of services are not yet available. Even for cases in which complete or near complete source data are available, the extent to which BEA relies on these source data in the first estimates varies. For most of the goods trade data, for instance, BEA's estimates closely mirror the source data from the Census Bureau. For transactions in securities, on the other hand, experience has shown that exclusive reliance on source data can lead to large revisions. Therefore, some judgmental and other adjustments are made to produce a first estimate that better anticipates the later estimates.

Source data may arrive too late to be included in a first estimate and are commonly revised or updated. Therefore, a revised estimate—the "second" esti-

mate—for that quarter's transactions is released 3 months after the first estimate, based on the more complete and revised source data.

A further revised estimate—the "third" estimate—is released in June of the year after the reference year. If warranted, subsequent revised estimates are released in June of each subsequent year. The most recent vintage of these revised estimates is termed the "latest estimate."12 Both the third estimate and the latest estimate are released in the June "annual" revisions.13 BEA incorporates updated quarterly source data and new annual surveys, as well as data from new sources in preparing revisions. Frequently, annual revisions incorporate results from benchmark surveys. Benchmark surveys, which are normally conducted very 5 years, are more comprehensive and complete than quarterly or annual surveys and allow for more robust evaluation of the internal consistency of individual reports. Previous results from higher frequency surveys are reconciled with the benchmark results or revised as needed.

In addition, BEA may introduce new methodologies, definitions, classifications, or tabular presentations in the yearly annual revisions of the ITAs. The results of any such improvements are incorporated into estimates for earlier time periods to maintain series consistency. The time periods covered by annual

^{12.} Because past publications had little need to distinguish estimate vintages in the manner done here, this terminology—first, second, third, latest—is not used by BEA in other articles discussing the ITAs. To the extent that it is useful in other articles to discuss vintages, the terms "preliminary," "previously published," and "revised" are used descriptively, as in "estimates are preliminary" (referring—mostly—to the first estimates) or "previously published estimates have been revised" (referring to any estimate past the first).

^{13.} Each year, an article in the July Survey discusses the results of the June revisions. For the most recent article, see Jeffrey R. Bogen and Jessica M. Hanson, "Annual Revision of the U.S. International Transactions Accounts," Survey 92 (July 2012), 35–46.

Table 1. Availability of Primary Source Data for the Vintages of the Estimates for Selected Accounts

			Current account		
Primary data sources	First estimate	Second estimate	Third estimate	Fourth estimate	Later estimates
Trade in goods ¹					
U.S. Census Bureau, compiling data mostly from Automated Export System and Automated Commercial System	Primary source data fully available, some missing data on BOP adjustments	Some revised source data on BOP adjustments	Revised primary source data and source data on BOP adjustments	Revised source data on BOP adjustments	Revised source data on BOP adjustments
Travel services		1		,	
Traveler arrival and departure data, U.S. Customs and Border Protection; Statistics Canada and Bank of Mexico	Most source data available; trend-based projections otherwise	Additional and revised source data	Revised source data	Revised source data	Revised source data if available
Other transportation services					
Four BEA surveys; U.S. Census Bureau; U.S. Army Corps of Engineers	Most source data available; trend-based projections otherwise	Revised source data	Nearly all source data available; some revised data	Revised source data if available	Revised source data if available
Royalties and license fees; "other" private	e services				
BEA's quarterly and benchmark surveys of services	Trend-based projections	Some survey data available	Additional and revised survey data	Revised survey data	Revised survey data
Direct investment income					
BEA quarterly and benchmark surveys of direct investment	Some survey data available	Additional survey data	Additional survey data	Additional survey data	Survey data revised and reconciled with benchmark survey data
Other private investment income		1			I
Treasury Department monthly, annual, and benchmark surveys; representative yields; Federal Reserve; foreign central banks	Source data fully available	Revised source data	Source data revised and reconciled with annual or benchmark survey data	Source data revised and reconciled with annual or benchmark survey data	Source data reconciled with benchmark survey data
		1	Financial account	,	1
Primary data sources	First estimate	Second estimate	Third estimate	Fourth estimate	Later estimates
Direct investment					
BEA quarterly and benchmark surveys of direct investment	Some survey data available	Additional survey data	Additional survey data	Additional survey data	Survey data revised and reconciled with benchmark survey data
Transactions in U.S. Treasury securities		I			1
Treasury International Capital S and BL-2 forms	Source data fully available	Revised source data	Source data revised and reconciled with annual or benchmark survey data	Source data revised and reconciled with annual or benchmark survey data	
Transactions in long-term securities other	r than U.S. Treasury secu	rities			I
Treasury International Capital S form (monthly) and related annual and benchmark surveys	Source data fully available	Revised source data	Source data revised and reconciled with annual or benchmark survey data	Source data revised and reconciled with annual or benchmark survey data	
Transactions reported by U.S. nonbanks	1	I	1	1	1
Treasury and BEA surveys; Depository Trust Corporation records; Federal Reserve; Bank of International Settlements; foreign central banks	Most source data available	New and revised source data	Revised source data	Revised source data if available	Source data reconciled with benchmark survey data
Transactions reported by U.S. banks and	securities brokers				
Treasury International Capital BC, BL, and BQ forms	Source data fully available	Revised source data	Revised source data	Revised source data if available	Source data reconciled with benchmark survey data

^{1.} Balance of payments (BOP) adjustments are procedures used to bring the coverage and valuation of the Census Bureau basis goods trade data into conformity with balance of payments concepts.

revisions depend, in part, on the nature of the revisions and the availability of source data.

There are differences in source data availability and timing. For some accounts, source data are quickly finalized; for others, source data continue to be revised and improved over several years. For exports and imports of goods, BEA's first estimates are based primarily on revised monthly data received from the U.S. Census Bureau. These data are, in turn, compiled from legally mandated, nonsurvey documents submitted to the Census Bureau or the U.S. Customs authorities with almost every shipment of merchandise, except those of very low values.14 BEA makes some minor adjustments to these primary source data to put the data on a "balance of payments" basis. 15 Revisions to data from the Census Bureau are not available until BEA's third estimate (the annual revision); any revisions incorporated in the second estimate are due to revisions to BEA's adjustments. After the third estimate, there are generally no further revisions to the source data from the Census Bureau.

For exports and imports of services, source data availability at the time of the first estimate is much less complete even though data availability for services has improved in recent years. Following its 2006 benchmark survey of international services, BEA implemented a quarterly follow-on survey for transactions in all types of services covered by the benchmark survey. Previously, annual surveys had been the primary source for some of the estimates of quarterly services trade. The quarterly surveys allow for a better representation of the quarter-to-quarter changes in services trade, but these data do not begin to become available for estimation purposes until the second or third estimate. Thus, the first estimate must be prepared using projections. Past the third estimate, source data do become more complete over time in some accounts, so revisions continue to be made.

Outside of data for trade in services, the other main type of data collected directly by BEA is data on direct investment income and financial flows. In contrast to

data from BEA's services trade surveys, source data on direct investment are available for, and used in, the first ITA estimate. However, by the time of the first estimates, survey reports received by BEA often represent less than half of the population of direct investment (in terms of account totals). BEA's second estimates of direct investment income and financial flows are based on an increase of approximately 20 percent in the availability of reported survey data, and the third estimates are based on another increase of approximately 10 percent in data availability. Smaller increments of source data availability are incorporated in later vintages. Results of benchmark surveys of direct investment, conducted every 5 years, are utilized when available. These surveys have lower reporting thresholds, higher response rates, and more complete data on income, balance sheets, and other aspects of direct investment.

BEA's first estimates of direct investment income and financial flows are constructed in large part by calculating growth rates for companies that have provided prompt survey responses and applying those rates to nonresponders. In doing so, BEA endeavors to apply growth rates conservatively; entry of new companies into the universe is not assumed, and outliers are dropped when applying growth rates to nonresponders.

For a large portion of the source data received from the Treasury International Capital (TIC) system for use in BEA's financial-accounts estimates and in its estimates of "other" private investment income, revisions can be considerable and can occur for several years. For instance, BEA's first estimates of securities transactions are based on monthly surveys of transactions conducted by the Treasury Department's TIC system. The surveys have a relatively small number of respondents, high reporting thresholds, and allow for the consolidation of transactions from a number of different transactors on a single report. These source data are revised for BEA's second estimate. For BEA's third estimate, data on securities positions are available from a separate TIC survey. These positions data are reconciled with revised transactions data, a process that can generate substantial revisions to BEA's accounts.

As noted, for several accounts, the earliest available source data are ultimately reconciled with, or replaced by, results from benchmark surveys. These benchmark surveys are conducted approximately every 5 years but occur in different years for different accounts. The lack of synchronicity means that the incorporation of results from benchmarks does not necessarily have a strong impact for the most aggregate accounts. At more

^{14.} In other words, the source data are based on reports covering nearly the entire "universe" of trade in goods.

^{15.} These adjustments are procedures used to bring the coverage and valuation of the Census Bureau goods trade data into conformity with the concepts and definitions used to prepare the international and national economic accounts. Broadly, these adjustments are necessary (1) to supplement coverage of the Census basis data, (2) to eliminate duplication of transactions recorded elsewhere in the international accounts, (3) to value transactions according to standard definitions, and (4) to include certain changes in ownership that occur without goods crossing the customs boundary of the United States.

disaggregated levels, however, the incorporation of benchmark results can have a significant impact on later vintage estimates and even on vintages as early as the third estimate, as the results of the benchmark survey are spread forward in time.

A framework of four estimate vintages—first, second, third, and latest—is used in this article to provide structure to the analysis of the revisions of the quarterly ITA estimates. ¹⁶ Although this does not completely consider all of the estimates and ignores some irregularly timed revisions, it captures most of the key features of BEA's estimate/revision release schedule. ¹⁷

The terminology used for revisions is based on the vintage of the estimates. For example, the first estimate of second-quarter transactions is released in September. The second estimate of those transactions is released in December. The "first-to-second" revision is defined as the difference between those two estimates—the December estimate minus the September estimate. Similarly, the "first-to-third" revision is defined as the difference between the third estimate and the first estimate.

Because there are several vintages of each estimate, there is a large number of implicitly defined revisions. For instance, the first estimate could be compared to the second estimate, the third estimate, or the latest estimate to define three different revisions. Similarly, the second estimate could be compared to the third estimate or the latest estimate to define two more revisions. This article focuses primarily on the first-to-third revision—that is, the difference between the third estimate and the first estimate. As noted earlier, the third estimate is released anywhere from one to four quarters after the release of the first estimate. The article secondarily focuses on the first-to-latest revision. Although for many purposes, the

first-to-latest revision provides the most useful information, the use of the first-to-third revision allows for an examination of the effects of changes to source data, abstracting in large part from potentially distortionary effects that arise when changes are made to definitions or major methodologies. To complement these two foci, the article includes a brief analysis of the more complete roster of revisions.

International investment position (IIP) estimates

Unlike the ITAs, which measure transaction *flows* between the United States and foreign countries, the IIP accounts measure *stocks*. In particular, they measure the value of U.S.-owned assets abroad and the value of foreign-owned assets in the United States.

Much of the source data for the IIP accounts are the same as the source data used to construct the financial account of the ITAs. In fact, nearly every *stock* (or "position") line in table 2 of the IIP accounts has a counterpart *flow* line in the financial account in table 1 of the ITAs. However, the IIP accounts also rely on data on prices and exchange rates that are not used for the ITAs.

Historically, the IIP accounts have been released once a year, in June. ¹⁹ The first estimate of outstanding positions of claims and liabilities as of December 31 of the reference year is made in June of the following year. The second estimate is made in the June that falls 2 years after the reference year. Each year another estimate is (potentially) released. ²⁰ In this article, the focus is only on the first-to-second revision—that is, on the difference between the second estimate released in June 2 years after the reference year and the first estimate released 1 year prior. ²¹

^{16.} Three technical issues deserve mention. First, there may be fourth, fifth, sixth, and so on estimates made prior to the latest estimate. For the most part, these intervening estimates are unexamined in this article. This article also ignores the rare and irregular estimates that can be made between the second estimate (the quarter after the first estimate) and the third estimate (June following the reference year), or between third and fourth estimates, between fourth and fifth estimates, and so on. Finally, the article ignores the fact that estimates for some accounts change slightly in the March release following the reference year to force quarterly seasonally adjusted estimates to add to annual totals.

^{17.} To avoid internal inconsistency, one slight modification to the identification of vintages is made. In the approach described, the second estimate of fourth-quarter transactions occurs at the same time as the third estimate of those transactions (in June following the reference year). To avoid one in four second estimates exactly matching the associated third estimates, the third estimate is given precedence. For this case, there is a "second" estimate for first-, second-, and third-quarter transactions, but the "second" estimate is undefined for fourth-quarter transactions. The preference given the third estimate is not arbitrary, as this means that all third estimates, but no second estimates, are associated with the June annual ITA revisions. The June revisions generally incorporate more complete and accurate source data than the second estimates, incorporate updates to seasonal adjustment factors, and reflect changes that are not applied in second estimates for other quarters.

^{18.} One ITA flow account—"financial derivatives, net"—is related to the financial derivatives asset position, the financial derivatives liability position, and the net financial derivatives position in the IIP accounts. In addition, for direct investment positions, there are two different valuations (each for both inward investment and outward investment) shown in the IIPs, but only one of these valuations corresponds to the flows shown in the ITAs

^{19.} This will change in March 2013. At that time, BEA will introduce quarterly IIP estimates. For additional information, see Kristy L. Howell, "Modernizing and Enhancing BEA's International Economic Accounts: A Progress Report," Survey 92 (May 2012): 37–50.

^{20.} As with the ITAs, most June releases present revised estimates only for those years for which revisions are relevant.

^{21.} Researchers at the Board of Governors of the Federal Reserve System have investigated some of the implications of longer-horizon revisions on the net international investment position. The contrast between long-horizon revisions to this position and long-horizon revisions to annual net financial flows in the ITAs is emphasized in Stephanie E Curcuru, Tomas Dvorak, and Francis E. Warnock, "Cross-Border Returns Differentials," *The Quarterly Journal of Economics* 123, No. 4 (2008): 1495–1530. Specifically, the former revisions have historically been much larger than the latter. This contrast is also discussed in Stephanie E. Curcuru, Charles P. Thomas, Francis E. Warnock, "Current Account Sustainability and Relative Reliability," *International Finance Papers* 947 (September 2008), along with the reliability (in a broad sense) of investment income estimates in the ITAs relative to that of IIP estimates.

Estimates of activities of multinational companies (MNCs)

As already noted, BEA directly collects data on direct investment income and financial flows that are used in the ITAs and the IIP accounts. Associated with this survey program, BEA also collects data on the activities of those entities involved in direct investment relationships: MNCs.²² Unlike the surveys on direct investment income and financial flows, the scope of these surveys is not confined to transactions between parent company and affiliates. Rather, it ranges across a broad selection of activities and financial indicators such as employment, sales, profits, international trade, research and development, and balance sheet items.

Surveys on the activities of MNCs are conducted on an annual basis, and preliminary estimates are generally released 19–23 months after the end of the reference year. Except in rare circumstances, the estimates are only revised once; revised estimates are released 1 year after the preliminary estimates. Estimates are published for three types of entities associated with direct investment to or from the United States: U.S. parent companies, foreign affiliates of U.S. parent companies, and U.S. affiliates of foreign parent companies.

III. Methodology

This section provides an overview of the definitions and formulas used in the article. The chief goal is to describe various methods used to calculate the mean revisions (MRs) and mean absolute revisions (MARs). In calculating these measures, scaled revisions are used, but the suitability of the scaling methods differs by account type and the objective of the analysis. In all, four different scaling methods are presented: scaling by item values, scaling by the sum of unsigned components, scaling by trend quarter-to-quarter absolute changes, and scaling by trend GDP.²³ An algebraic representation

of an unscaled revision is presented first, followed by a discussion of scaling in general terms, definitions of MRs and MARs, and finally, a presentation of the scaling methods.

Revisions and average revisions

A revision is the difference between a later vintage estimate and an earlier-vintage estimate. Published ITA estimates are expressed in current-dollar levels. For an estimate expressed as a level, as opposed to one expressed as a growth rate as would be common for GDP and the other NIPA accounts, 24 an unscaled revision for period t, $r_t^{e,l}$, can be expressed as

$$r_t^{e,l} = E_t^l - E_t^e$$

where E denotes a current-dollar (level) estimate, the t subscript denotes the period (quarter) for which the estimate applies, the e superscript denotes early vintage, and the l superscript denotes later vintage. The revision examined most frequently in this article is the first-to-third revision. This is given by

$$r_t^{1,3} = E_t^3 - E_t^1$$

Two simple measures—both averages—are used in this article to assess the overall size and direction of revisions. The first, the average of the revisions for some account over a given period, is called the mean revision (MR). For a scaled revision, $R_t^{e,l}$, the MR is:

$$MR^{e,l} = \frac{1}{T} \sum_{t=1}^{T} R_t^{e,l}$$

where t indexes quarters and T is the number of quarters over which the average is calculated. The MR indicates whether revisions are generally positive or negative. A positive MR means that the earlier estimates generally understate the later estimates; a negative MR means that the earlier estimates generally overstate the later estimates. A near-zero MR suggests either that early estimates are quite close to later estimates or that early-estimate overstatements and understatements largely offset one another.

Because revisions can be positive or negative, they may be offsetting. Therefore, it is also useful to look at

^{22.} A 10 percent ownership stake by an entity in one country of an entity in another is the threshold used to distinguish a direct investor from a portfolio investor. In surveys of activities of MNCs, special attention is given to situations where the ownership stake exceeds 50 percent, that is, majority ownership.

^{23.} The European Central Bank (ECB) regularly publishes reliability analyses of the balance of payments accounts and IIP accounts estimates for the euro area; for the most recent analysis, see European Central Bank, "Euro Area Balance of Payments and International Investment Position Statistics: 2011 Quality Report," (March 2012). Although much of the approach taken in those analyses is similar to the one taken here, different terminologies are used. For instance, the term MAR is not used at all. Instead, MARs associated with each different scaling method are given unique names. MARs for revisions scaled by item values are called mean absolute percentage errors and MARs for revisions similar to ones scaled by trend quarter-to-quarter absolute changes are called mean absolute relative errors. The ECB also use one measure with no counterpart here—the "mean absolute comparative error". That measure scales revisions for the financial accounts in the balance of payments by the corresponding positions in the IIP.

^{24.} BEA's previous revision studies have focused primarily on revisions to growth rates. Growth rate revisions are not examined in this article, both because ITA estimates are not generally presented in terms of growth rates and because growth rates are not meaningful when levels are close to zero or switch signs, as is the case, either in potential or practice, for several of the ITAs.

^{25.} The next subsection will cover scaling methods.

the mean absolute revision (MAR), which is the average of the absolute value of the revisions over a given period:

$$MAR^{e,l} = \frac{1}{T} \sum_{t=1}^{T} \left| R_t^{e,l} \right|$$

Because positive and negative revisions are not offsetting in the MAR, an MAR is at least as large as the MR for the same period. Although a large positive or large negative MR necessarily implies a large MAR, a small MR has no implication for the MAR. Revisions may both center around zero and be highly variable; in such a case, the MAR will be large and the MR will be small. In general, small MARs, like small MRs, are indicators of accuracy in early estimates.

Revision scaling methods

Analyzing revisions to current-dollar estimates raises two related difficulties. First, current-dollar estimates tend to increase over time due to economic growth and inflation. This gives undue weight to revisions for later periods if they are compared with revisions for earlier periods—as would occur if the earlier- and later-period current-dollar revisions were to be averaged. Second, it would be misleading to compare current-dollar revisions from one account with those of another account because one of the accounts may be much larger than another. A current-dollar revision that is relatively small for a larger account may be quite large for a smaller account. For example, in the current account of the ITAs, imports of goods are about three times as large as income payments. A \$1 billion revision to income payments would be proportionately larger and more significant than a \$1 billion revision to imports of goods.

Scaling resolves both of these difficulties. The appropriate scaling method can remove the effects of growth and inflation, and it can make revisions from two different accounts comparable. All of the revisions considered in this article are scaled revisions. A scaled revision, R, is calculated simply by dividing the unscaled revision by a scaling term and multiplying it by 100 to express it as a percentage. For the first-to-third revision, R is

$$R_{m,t}^{1,3} = 100 \times \left(\frac{r_t^{1,3}}{S_{m,t}^{1,3}}\right) = 100 \times \frac{E_t^3 - E_t^1}{S_{m,t}^{1,3}}$$

where *S* denotes the scaling term and the *m* subscript denotes whatever scaling method is used.

The selection of a scaling method entails a tradeoff between simplicity and suitability. Some methods are more intuitive than others but are not adequate to deal with every type of account in the ITAs. In addition, no single scaling method gives a complete picture of the size of revisions. The use of multiple scaling methods has the benefit of allowing for consideration of the pattern of revisions from a variety of perspectives.

The purpose of scaling is twofold: to create a consistent standard over time and to aid in comparing revisions across accounts. In large part, the usefulness of a scaling term can be judged by the following criteria:

- (1) Does the scaling term grow over time with the account transactions?
- (2) How well known and understood is the scaling term?
- (3) Is the time series of the scaling term relatively smooth?

If the answer to 1) is yes, the use of the scaling term will counteract the effects of economic growth and inflation that would otherwise cause later observations to be weighted more heavily in the calculation of means. For 2), the better known and understood the scaling term, the easier it will be to interpret MRs and MARs. For 3), smoothness in the series of scaling terms helps to ensure that pattern of change in the time series of scaled revisions primarily reflects the pattern of change in the time series of unscaled revisions.²⁶

In many cases, there is a tradeoff among these criteria. A scaling method may do well on one criterion but not so well on another.

A fourth criterion relates to whether:

- 4a) differences in the size of scaled revisions across accounts indicate differences in accuracy, or whether
- 4b) differences in the size of scaled revisions across accounts reflect differences in the size of dollar revisions.

Scaling by item values

Of the four different scaling methods used in this article, one stands out for its intuitiveness and simplicity: scaling by the value of the estimate itself. This is the first scaling method used in this study. Under this "item value" scaling method, the revision is expressed as a percentage of the earlier-vintage estimate. The scaling term for this scaling method (denoted by *iv*) is

$$S_{iv,t}^{e,l} = \left| E_t^e \right|$$

^{26.} In addition, smoothness in the scaling term can be viewed as a judicious precaution. To the extent that the ideal scaling term is unknown, smoothness at least serves to prevent the choice of a suboptimal scaling term from generating substantial idiosyncrasies in the series of scaled revisions.

For example, if exports of goods are revised from \$100 billion to \$104 billion, the scaled revision is 4 percent.

The use of this scaling method is most appropriate when account size and revision size are expected to be directly correlated. For accounts with such properties, item value scaling does very well on criteria (1), (2), and (4a) but, depending on the volatility of the series, may not do so well on criterion (3).

Item value scaling is used in this article for most accounts in the current account. Its use would be misleading for two different types of accounts: (1) accounts with both positive and negative observations, and (2) accounts that are constructed as the sum of positive and negative components, or as the difference of positive components, even if the observations themselves all have a common sign.

Scaling by the sum of unsigned components

This scaling method is similar to the item value scaling method, except that the early vintage estimate used as the scaling term is replaced by the sum of the unsigned components of the early vintage estimate. This scaling term (denoted by sc for sum of unsigned components) is

$$S_{sc,t}^{e,l} = \left(\sum_{j} \left| c_{t,j}^{e} \right| \right) = \sum_{j^{+}} c_{t,j^{+}}^{e} - \sum_{j^{-}} c_{t,j}^{e}$$

where the j^{th} component of the estimate is $c_{t,j}^e$. The components are divided into two groups: positively signed components, indexed by j^+ , and negatively signed components indexed by j^- . Note that by construction, the estimate equals the sum of the signed components:

$$E_t^e = \sum_j c_{t,j}^e = \sum_{j^+} c_{t,j^+}^e + \sum_{j^-} c_{t,j^-}^e$$

This scaling method is used for current-account balances. In general, its use is appropriate for accounts with both positively and negatively signed components, as long as these components are known. If all components take the same sign, this scaling term is equivalent to the item value scaling term. MRs and MARs constructed using this method are quantitatively comparable to item value scaled MRs and MARs. Thus it is meaningful to compare numerically, for instance, the item-value-scaled MAR of exports to the MAR of the trade balance scaled by the sum of its unsigned components. Like item value scaling, scaling by the sum of unsigned components does very well on criteria (1), (2), and (4a) but may or may not do well on criterion (3), depending on the volatility of the unsigned sum.

Scaling by trend quarter-to-quarter absolute changes

Because some accounts in the ITAs are net accounts whose components are unmeasured (or not fully measured), item value scaling is not appropriate. Moreover, because components are unmeasured, scaling by the sum of unsigned components is infeasible. Chief among the accounts with these characteristics are financial accounts, though net unilateral current transfers in the current account and the capital account also share these characteristics.²⁷ Accordingly, another scaling method is needed.

The use of scaling by "trend quarter-to-quarter absolute changes" has the virtue of general applicability; that is, it could, in principle, be used for any account. However, it does not share with the other two scaling methods already discussed the same level of intuitive simplicity. Nor does it share with the other two methods a rough comparability with growth rate methods used in other BEA revisions studies. The method of scaling by trend quarter-to-quarter absolute changes is predicated on the size of revisions being related to the "typical" quarter-to-quarter change in account value in addition to the gross volume of transactions; that is, an account whose value varies greatly from one quarter to the next will tend to be more difficult to measure—and thus be subject to greater revision—than one whose value varies little.28

Because quarter-to-quarter changes can be either positive or negative, the method uses absolute changes. For many series, the absolute changes vary considerably from quarter to quarter. In addition, any single quarter-to-quarter change can be arbitrarily close to zero. To provide a more stable scaling term (criterion 3), and one that is not liable to become vanishingly small, some sort of measure of the typical change is required.

^{27.} For instance, net flows for some of the financial accounts are estimated by subtracting a beginning-of-period balance from an end-of-period balance; an example is "U.S. claims on unaffiliated foreigners reported by U.S. non-banking concerns"—ITA table 1, line 54. For such accounts, neither gross outflows nor gross inflows—the terms required to compute the sum of unsigned components—are observed. Similarly, gross transaction detail is lacking at the ITA table 1 level of detail for most accounts in the financial account. (Two relatively small accounts—line 47, "U.S. credits and other long-term assets" and line 48, "Repayments on U.S. credits and other long-term assets"—are exceptions.) There may be some accounts for which the requisite gross transactions detail is available in other ITA tables or in the underlying source data, but, for uniformity, these data are not utilized in this article.

^{28.} A simpler alternative to using typical quarter-to-quarter changes as the scaling term would be to use actual quarter-to-quarter changes in account values. However, this approach suffers from the same limitation as item-value scaling: the changes change signs and can be arbitrarily close to zero. This approach could be modified by taking absolute values to resolve the problem of switching signs and by taking the average to resolve the problem of any individual change being near zero. Small revisions relative to the resulting average period-to-period changes would provide evidence that the initial estimate of period-to-period changes reflects actual economic activity rather than estimation error. However, scaling each revision by a whole-period average of absolute changes ignores the impact of inflation and general economic growth.

If a series does not tend to grow over time, a simple average of these absolute changes would suffice. However, most of the series examined in this article grow over time, so trend values of the absolute changes are used instead.²⁹ Specifically, individual scaling terms for each observation (quarter) are generated using the Hodrick-Prescott filter, with the smoothing parameter set to 1,600.³⁰

Algebraically, the scaling term (using an *ac* subscript to denote <u>a</u>bsolute <u>c</u>hanges) is

$$S_{ac,t}^{e,l} = trend\{\left|\Delta(E_t^L)\right|\} = trend\{\left|E_t^L - E_{t-1}^L\right|\}$$

where $trend \{x\}$ denotes the trend extracted from the application of the Hodrick-Prescott filter to series x, and L denotes that the latest vintage estimates are used in extracting the trend.

This scaling method is used in this article primarily for the financial account. Because it scales by a function of changes rather than levels, MRs and MARs obtained using this method are not quantitatively comparable to those obtained using the prior two methods.

Scaling by trend GDP

To meet criterion (4b), this scaling method uses a common scaling term for every account rather than an account-specific term. The scaling term is the trend value of current-dollar GDP. GDP is used here to satisfy criterion (2); it is widely known and understood and it facilitates easy interpretation. Using the trend value rather than GDP itself helps to satisfy criterion (3), as the trend is smoother than the actual values. As with the previous method, the trend is extracted by an application of the Hodrick-Prescott filter, with smoothing parameter set to 1,600, to the latest vintage of estimates:

$$S_{gdp,t}^{e,l} = trend\left\{Y_t^L\right\}$$

where Y_t^L is a representative member of the current-dollar GDP series.

Like scaling by trend quarter-to-quarter absolute changes, scaling by trend GDP can be applied to any account. However, unlike that method, and unlike the other two methods used in this article, comparing MRs and MARs of one account to those of another does not indicate whether one account's early estimates are more accurate than the other. Rather, it indicates which account's dollar revisions tend to be larger than the other criterion (4b).

The following summarizes the 4 scaling methods and how they are used in this article.

Scaling Methods

Scaled by	Most suitable for	Accounts analyzed in this article
Item values	Accounts that measure aggregation of transactions or activities	Current-account components; international investment position accounts; multinational company activities
Sum of unsigned components	Net accounts that mea- sure differences in mea- sured transactions	Most current-account balances
Trend quarter- to-quarter absolute changes	Net accounts that measure differences in unmeasured transactions	Financial account; net uni- lateral current transfers; capital account; and key current-account aggre- gates for comparison
Trend gross domestic product	All accounts	All accounts

IV. Directional Measures and Contributions to Growth

Chart 4 showed that in most cases, first estimates of key accounts in the ITAs match later estimates in terms of the quarter-to-quarter direction of change. In this section, matching of directional changes is examined at greater length. Table 2 expands in three ways on the frequency shares shown in the chart for comparisons of the first estimate with the third estimate. First, it presents several more accounts than shown in the chart. Second, it decomposes the matches and non-matches. Third, it examines a related phenomenon: acceleration/deceleration.

The first column of table 2 presents the frequency with which the first ITA estimates show the same direction of change as the third estimates.³¹ In the vast majority of cases, these two estimates show a common direction of growth, indicating that in most cases first

^{29.} This limits the extent to which early scaling terms are overweighted and later scaling terms are underweighted.

^{30.} The Hodrick-Prescott filter is a procedure used to separate out the quarter-to-quarter deviations from trend in a time series. The procedure uses the time series values as inputs and yields the deviations and the trend values as outputs. The procedure is not unique; different parameter settings can yield somewhat different results. In this case, the trend is extracted from a time series of absolute values of quarter-to-quarter changes with the filter's smoothing parameter set to 1,600. (The choice of 1,600 for quarterly data was originally recommended by Hodrick and Prescott, and it is commonly used in practice; See Robert J. Hodrick and Edward C. Prescott, "Postwar U.S. Business Cycles: An Empirical Investigation," *Journal of Money, Credit and Banking* 29, No. 1 (Feb., 1997): 1–16; and Morten O. Ravn and Harald Uhlig "On Adjusting the Hodrick-Prescott Filter for the Frequency of Observations," *Review of Economics and Statistics* 84, No. 2 (May 2002): 371–376).

^{31.} Algebraically, the first column gives the frequency of agreement between the first and third estimates on $\operatorname{sgn}(\Delta x_t) = \operatorname{sgn}(x_t - x_{t-1})$, where x_t is the value of some estimate x for quarter t. The second column gives the frequency with which the third estimate indicates $\operatorname{sgn}(\Delta x_t) \neq \operatorname{sgn}(\Delta x_{t-1})$. The third column gives the frequency with which the first estimate indicates $\operatorname{sgn}(\Delta x_t) = \operatorname{sgn}(\Delta x_{t-1})$ given that the third estimate indicates $\operatorname{sgn}(\Delta x_t) = \operatorname{sgn}(\Delta x_{t-1})$. The fourth column gives the frequency with which the first estimate indicates $\operatorname{sgn}(\Delta x_t) = \operatorname{sgn}(\Delta x_{t-1})$ given that the third estimate indicates $\operatorname{sgn}(\Delta x_t) \neq \operatorname{sgn}(\Delta x_{t-1})$. The fifth column gives the frequency of agreement between the first and third estimates on $\operatorname{sgn}(\Delta(\Delta x_t)_t)$.

^{1.} Percent of quarters in which the direction of change indicated in the first estimate matches that indicated in

estimates accurately capture the direction of changes in economic activity. For current-account items, this directional matching is mostly above 90 percent. For financial-account items, the matching is a bit lower, but mostly above 85 percent. The difference reflects a greater inherent ease in predicting the direction of change in the current account: as the second column of table 2 shows, turning points occur less frequently in the current account than in the financial account.

A handful of accounts show weaker directional matching, including the net capital account, the balance on services, the balance on income, and net financial flows. For the net capital account, the relatively poor matching is not surprising. Among other reasons, source data are difficult to obtain, a small number of individual transactions can generate relatively large changes, and turning points are relatively common.

However, difficulties in measuring directional change in the capital account do not imply difficulties in measuring directional change in broader aggregates as the volume of capital-account transactions is dwarfed by those in the current and the financial accounts.

Turning points are more common for "difference" accounts, particularly for the balances on services and income and for net financial flows. All that is required for a turning point to occur for these accounts is that there be a switch in terms of which of the two underlying components grows faster than the other (on an absolute, not a relative, basis). For accounts that are not measured on a difference or net basis, growth of transactions has to actually switch to contraction for a turning point to occur.

The third and fourth columns decompose the directional mismatches implied by the first column into false positives and false negatives. There is no obvious tendency towards one type of mismatch or the other.

The fifth column shows the frequency with which first estimates identify whether account values are accelerating or decelerating, using third estimates as the standard. For instance, if values increased both last quarter and this quarter, was this quarter's increase larger or smaller than last quarter's increase? In general, acceleration and deceleration matching is nearly as strong as matching of turning points. However, early estimates of both exports and imports of services match the later estimate acceleration/deceleration pattern less frequently than do estimates of some of the other accounts. This is likely a consequence of the fact that first estimates of trade in services draw on relatively little source data; for the early estimate, projections predominate.

Table 3 provides another qualitative measure of the performance of the first estimates. It gives the share of estimates for which the three largest component accounts-contributors to growth—whether positive or negative—in the first estimate of an aggregate retain their position as a contributor to growth in the third estimate. The first row of the table shows that for the aggregate "exports of goods and services and income receipts," the largest contributor to growth in the first estimate remains the largest contributor in 74.5 percent of third estimates. The largest contributor in the first estimate is the second-largest contributor in 19.6 percent, and is the smallest contributor in 5.9 percent, of third estimates.

For other aggregates, the stability of the ranking of contributions to growth is even greater. The currentaccount balance is of particular interest. For this balance, the largest contribution to growth is made by the same component in both first and third estimates 84

Percent of quarters in which the direction of change indicated in the first estimate matches that indicated in the third estimate.
 Percent of quarters that are turning points—an increase (decrease) in the prior quarter—in the third estimate.

Addendum Gross domestic product 1	-0.12	0.79

^{1.} The "advance" and the "first annual" current-dollar level estimates are used. Nores. Revisions are computed as the ratio of the difference between third estimate and first estimate to the first estimate and are expressed in percent terms.

Natural signs used for revisions and estimates. See footnote 32 in the text.

percent of the time. Not surprisingly, the stability of the second-largest and third-largest contributions is not as great as that of the largest contribution for this balance and for the other aggregates shown in the table. Both the second-largest and third-largest contributions are made by the same component in both the first and third estimates only 55 percent of the time.

V. Mean and Mean Absolute Revisions to the Quarterly ITAs

In this section, revisions to three groups of accounts are considered using the most appropriate scaling measures for each group. Revisions to current-account components are distinguished from revisions to current-account balances. Financial-account revisions are examined together with capital-account revisions and revisions of net unilateral current transfers. After the analysis by group, sizes of revisions are compared across the ITAs more broadly.

Current-account components

For the components, but not balances, of the current account, dollar revisions are scaled by item values—that is, by the early-vintage estimates themselves—and are expressed as percentages. The MRs and MARs resulting from comparing first estimates of key accounts in the current account with the corresponding third estimates are shown in table 4.32 For the two broadest aggregates—"exports of goods and services and income receipts" and "imports of goods and services and income payments"—revisions are generally small. MRs are less than 1 percent for these two accounts.³³ MARs are about 1 percent. Although estimates of exports of goods and services and income receipts tend to be revised up slightly more than down, revisions for both accounts are broadly comparable to those of GDP.³⁴

The picture is more varied for more disaggregated accounts. Revisions to goods exports and goods imports are even smaller than revisions to the two aggregates:

^{32.} Note that the estimates and revisions used for table 4 and throughout this article use "natural" signs, not the sign conventions imposed by the ITA framework. For instance, imports of goods enter the ITAs with a negative sign, that is, as a debit, as these transactions reflect an outflow of payments (dollars). In table 4, however, imports of goods are measured as a positive number so that the revision measures are more easily interpreted.

^{33.} All but two of the ITA MRs in table 4 are positive. This does not appear to reflect a systematic pattern over the current account of upward revisions. None of the MRs in that table are statistically different from zero at the 5 percent level using a standard t-test.

^{34.} Several tables in this article include current-dollar GDP—which is not part of the international accounts—as an addenda account. This is done only to provide an additional frame of reference against which the reported MRs and MARs can be judged, as the average revisions of GDP estimates have been examined at length in other BEA articles on revisions. No direct connection between the ITA MRs and MARs and those of GDP should be inferred even though one of the components used to construct GDP under the expenditure approach is the trade balance. Although there are some slight differences in definition between the ITA trade balance and that used in GDP, the revisions to both should be quite similar. Note that the averages reported for GDP here will not match those shown in earlier articles because different scaling methods are used. In addition, the time periods examined differ.

MARs are about one-half of 1 percent.³⁵ However, MARs for services trade and for income transactions are substantially higher: about 2 percent for services trade, a bit lower for exports than for imports, and 3.5 percent for income receipts and income payments. Differences noted earlier in the availability of source data contribute to the differences in revisions. Specifically, the Customs Bureau data on goods trade are available in a much timelier manner than much of the source data used in the services trade estimates and are available more completely for the first estimate than the source data used for estimates of income receipts and payments.

Another explanation for the difference in MARs between goods and services relates to the periodicity of data collection for goods and services trade. Although the source data underlying the quarterly estimates of services trade have improved in recent years, these improvements will not necessarily be reflected in lower MARs. The relatively new quarterly surveys of trade in services allows for a better representation of the quarter-to-quarter changes, but this benefit accrues primarily to later estimates—that is, to third and later

Table 5. Mean and Mean Absolute Revisions of Quarterly Estimates of Current-Account Components, Item-Value Scaling, Various Vintages, 1999–2011

[Percent of account value]

	1.23	3.53	2.86	5.04	4.21	3.62

Notes. Revisions are computed as the ratio of the difference between later estimate and earlier estimate to the earlier estimate and are expressed in percent terms.

Natural signs used for revisions and estimates. See footnote 32 in the text.

vintages. Even if earlier estimates were also to improve in a similar manner, they may be less consistent with later estimates—which is what MARs measure—than when both vintages were based on annual surveys.

For income receipts, the MAR of 3.5 percent is accompanied by a MR of 2.5 percent. Although not statistically significant at conventional levels, the MR is relatively large, suggesting some imbalance in the direction of revisions. Of the two components of income receipts, the MR of direct investment income receipts, at 3.1 percent, is particularly large. The size of these revisions may be related to BEA's "conservative" approach to estimation of these flows. As noted earlier, entry of new companies into the universe is not assumed, so early estimates may not fully reflect the entire population of MNCs. Consequently, when the previously unreported data are ultimately received, revisions are often upward in direction.³⁶

Another reason that MARs for income receipts and payments are higher than those for goods exports and imports is that income flows show greater relative quarter-to-quarter variability than goods flows. More quarterly variability in account values generally produces a greater estimation challenge. Relative to account values, the average absolute quarterly change—that is, the average absolute growth rate—from 1999–2011 is 5.2 percent and 6.3 percent, respectively, for income receipts and payments, compared with 2.7 percent and 4.0 percent, respectively for goods exports and imports.

The first-to-third results analyzed thus far consider how closely the first estimates in the current account match the third estimates that are released from 3 to 12 months after the first release. Different results may emerge, however, if different revision horizons are considered. MRs and MARs are shown in table 5 for 10 key accounts for all revision horizons. The first column shows that the initial revisions to the quarterly estimates—first-to-second MARs of 0.4 percent and 0.3 percent for the two top-level items (exports of goods and services and income receipts; imports of goods and services and income payments)—are generally much smaller than the first-to-third revisions shown in the second column (and in table 4). Second-to-third

^{35.} Scaled MARs may increase with further disaggregation, as revisions to one component that are offset in the aggregate by revisions to another component are exposed in the disaggregated measures. This increase need not always occur, however, for the component with smaller revisions; a disaggregation-related increase is less likely to occur for the component with smaller revisions the larger the disparity between the component MARs. In this case, the disparity between the goods exports MAR and the services-exports MAR is sufficiently large that the goods exports MAR is lower than the MARs for the aggregates that include both goods and services exports. The same holds for imports.

^{36.} This argument should also apply to estimates of direct investment income payments. However, the MR for payments is small. The difference in outcomes may stem in part from the lower underlying growth rates for income payments. Comparing direct investment income flows for 2011 with those for 1999, receipts rose 203 percent, while payments rose only 148 percent. When the underlying growth rate is lower, revisions arising from the effects of a conservative estimation approach should be smaller. The difference may also stem from the use during much of the period being examined of a separate survey on U.S. businesses established or acquired by foreign direct investors. This survey, which was discontinued after 2008, had no counterpart for outward direct investment. It may have provided more complete and timely information on entry into the inward direct investment universe than was available for outward direct investment.

revisions (third column), in contrast, are generally similar to the first-to-third revisions.

Of particular interest is the fourth column, which presents information on MRs and MARs between the first estimate and the latest estimate. For exports of goods and services and income receipts, the first-to-latest MAR is much larger, at 2.9 percent, than the corresponding 1.0-percent first-to-third MAR. Most of these large revisions are upward; the MR is 2.8 percent.³⁷ Of the next level components of this account, large MRs and MARs for income receipts, at about 9 percent, are prominent.^{38, 39} There are similar, if less pronounced, differences in the magnitude of revisions (first-to-latest versus first-to-third) for several accounts.

That there are measurable differences in revisions across horizons is not surprising. Over time, new data sources are identified and utilized, definitions and methodologies are changed, and other changes are incorporated. Often these changes have a cumulative effect on the level of an estimate, but a smaller impact on estimates of quarter-to-quarter changes or growth rates. Nonetheless, the largest differences suggest that imprecision in early estimates for certain accounts—income receipts and payments, in particular—is not fully resolved by the time of the first subsequent June annual revision. This, in large part, is because the incorporation into estimates of income receipts and payments of data from benchmark surveys does not typically occur until several years after the reference year.

Current-account balances

Current-account balances are the differences between credits and debits for selected current-account categories. Table 6 shows MRs and MARs scaled by the sum of the unsigned components of the balance. In the case of the trade balance, revisions are scaled by the sum of exports and imports. This scaling method retains a key aspect of item-value scaling: as transactions volumes increase, dollar revisions get larger. The use of this method produces a measure of revisions to the trade balance that can be compared with, and will often be similar in magnitude to, revisions to the *sum of exports and imports*, a sum that is not actually an account but

is a value of interest that may be derived directly from the ITAs.⁴⁰

Table 6 indicates that relative to the size of the component flows, initial estimates of balances in the current account are generally quite representative of later estimates: MRs are close to zero and MARs are small. Revisions to balances display a similar pattern to those of their component accounts. The MAR of the balance on goods is smallest at 0.24 percent. Those of the balance on services and the balance on income are somewhat larger. Overall, the MAR of the current-account balance is 0.47 percent, roughly half the MARs of its components—1.16 percent for credits and 0.85 percent for debits—indicating that revisions of the two components are often offsetting.

MRs are very close to zero for the balance on goods and the balance on services. For the current-account balance, the MR is also near zero. For the balance on income, the MR is 1.51 percent; estimates of the surplus on income tend to be higher in later estimate vintages because, as previously discussed, estimates of income receipts are generally revised upward.⁴¹

Financial account

Like current-account balances, the accounts in the financial account provide a net measure of transactions. However, unlike current-account balances, gross transactions value associated with the financial accounts' net value is typically not measured. Hence, MRs and MARs are calculated for financial accounts using scaling by trend values of the quarter-to-quarter absolute

Table 6. Mean Revisions and Mean Absolute Revisions of First Quarterly Estimates of Current-Account Balances, Sum-of-Unsigned-Components Scaling, 1999–2011

[Percent of sum of unsigned components of account]

Account	Mean revision	Mean absolute revision
Balance on goods	-0.03 0.05 -0.01 1.51 0.25	0.24 1.21 0.34 1.95 0.47
Addenda Exports of goods and services and income receipts Imports of goods and services and income payments	0.72 0.01	1.16 0.85

Notes. Revisions are computed as the ratio of the difference between later estimate and earlier estimate to sum of unsigned components of the earlier estimate and are expressed in percent terms. Natural signs used for revisions and estimates. See footnote 32 in the text.

^{37.} This MR is statistically significant at the 5-percent level. The third-to-latest MR is also statistically significant for this account. The three "to-latest" MRs for exports of goods are also statistically significant at the 5-percent level.

^{38.} The three "to-latest" MRs for income receipts are statistically significant at the 10-percent level, but not at the 5-percent level.

^{39.} A further decomposition of income receipts (not shown in the table) indicates that both direct investment income receipts and other private income receipts make substantial contributions towards the large MR and MAR

^{40.} The sum of exports and imports as a percentage of GDP is often used as a measure of openness to trade. For example, see Organisation of Economic Co-operation and Development (OECD), *Measuring Globalisation:* OECD Economic Globalisation Indicators 2010 (Paris: OECD Publishing): 58–59.

^{41.} However, neither this MR nor any of the others in table 6 is statistically significant.

changes. Table 7 displays MRs and MARs for key accounts in the financial account as well as for net unilateral transfers in the current account and net capital-account transactions.

On average, first-to-third revisions of net financial flows are 37.4 percent as large as the trend quarter-toquarter changes in this account. Because of differences in scaling methods, this MAR cannot be directly compared with those presented in earlier tables. To provide a sense of whether the financial account MARs in table 7 are relatively large or small, the table also shows trendquarter-to-quarter-absolute-change-scaled MARs for key accounts in the current account and for GDP. The MAR for the current-account balance is 47.0 percent, which, like the MAR for net financial flows, is smaller than that for GDP.42 When scaling by trend quarterly changes, MARs that are well below 100 percent indicate that early estimates typically identify the correct quarterly direction of change and that subsequent estimates tend not to alter greatly the magnitude of that quarterly change.

For the two largest components of net financial flows, revisions are 19.7 percent (U.S.-owned assets abroad) and 23.1 percent (foreign-owned assets in the United States) of the trend of their respective quarterly changes. MARs for major components in the financial account are of a similar magnitude to those for major

42. A calculation was presented in the introduction of this article showing that for this balance the average unscaled revision is 61 percent as large as the average quarter-to-quarter absolute change. These two percentages roughly measure similar things. In large part, the difference between the 47 percent shown in table 7 and the 61 percent from the introduction can be attributed to the fact that the calculation in table 7 corrects for inflation and economic growth while the calculation in the introduction does not.

Table 7. Mean Revisions and Mean Absolute Revisions of First Quarterly Estimates, Trend-Quarter-to-Quarter-Absolute-Change Scaling, 1999–2011

components of the current account. Most of the MRs in the financial account are also fairly close to zero.⁴³

The similarity of the financial-account MRs and MARs in table 7 with those in the current account is more a result of large quarter-to-quarter absolute changes than of small dollar-value revisions. In general, quarter-to-quarter absolute changes tend to be much larger in the financial account than in the current account; that is, financial-account volatility exceeds current-account volatility. This difference in volatility is also shown in chart 6, which compares quarter-to-quarter absolute changes for a key component of the current-account balance with those of a key component of net financial flows. Absolute changes are shown as solid lines, and trend values of these changes are shown as dashed lines. For 2011, the trend quarterly change of net flows of foreign-owned assets in the United States was about \$219 billion compared with about \$24 billion for imports of goods and services and income payments, despite the latter account showing larger net flows.44

The relatively large quarterly changes in financial-account values make estimation of quarterly values challenging. Producing estimates that are close to the true value requires a substantial amount of information. The scaling method used for financial-account revisions brings a "degree-of-difficulty" adjustment to comparisons of MRs and MARs across the various

Chart 6. Absolute Quarterly Changes for Selected Components of Current Account and Financial Account, 1999–2011

^{43.} Foreign official assets in the United States has the largest MR in the financial account. However, neither that MR, nor any of the others in table 7 are statistically significant.

^{44.} The \$219 billion difference and the 23 percent MAR shown in table 7 suggests that for each quarter in 2011, the expected absolute revision to foreign-owned assets in the United States would be just over \$50 billion.

ITAs, one that suggests that early financial account estimates, despite the relative lack of complete source data coverage, are reasonably accurate.

Comparing the size of revision across accounts

To assess the contributions that revisions to two or more component accounts make to the total revisions of an aggregate account, it is useful to compare dollar revisions of one account to those of another. Comparing dollar revisions also indicates which of two or more unrelated accounts tends to have the largest revisions.

As described in the section on scaling methods, scaling by the trend of current-dollar GDP facilitates the comparison of dollar revisions while still accounting for the history of economic growth and inflation.⁴⁵ However, as previously noted, the GDP-scaled MRs and MARs do not allow for a direct comparison of estimate accuracy across accounts. Table 8 and chart 7 show that, on average, first-to-third revisions of the current-account balance, with a MAR of 0.16 percent of (trend) GDP, are less than a fourth as large in dollar terms as revisions of net financial flows, with a MAR of 0.73 percent of GDP.

Financial accounts in general display very large dollar revisions. The GDP-scaled MARs of two financial accounts—"other foreign assets in the United States" and

Chart 7. GDP-Scaled Mean Absolute Revisions, 1999–2011

^{45.} To the extent that the ITAs have become larger over time relative to the total U.S. economy, recent quarters still carry some disproportionate weight in the averages.

Notes. Revisions are computed as the ratio of the difference between third estimate and first estimate to the trend value of the latest GDP estimate and are expressed in percent terms.

The sum of component MRs may not add to the MR of the higher-level aggregate due to rounding.

its aggregate "foreign-owned assets in the United States"—are even larger than that of GDP. These large dollar revisions have multiple causes, two of which have already been discussed. First, the financial accounts are quite volatile and, thus, estimation is intrinsically difficult. Second, their source data differ in nature and availability compared to some other accounts. In particular, for estimates of transactions in securities, first estimates are based on a less than fully comprehensive report of transactions. Third estimates are based on revised data on transactions that have been reconciled with a separate, more comprehensive survey on positions.

Although the item-value-scaled MARs for services trade are larger than those for goods trade, goods trade is much larger in total value. These two effects work in opposite directions with respect to the magnitude of dollar revisions. Table 8 shows that services trade revisions contribute at least as much as goods trade revisions to first-to-third revisions to combined goods and services trade flows. For exports, the GDP-scaled services MAR of 0.054 percent exceeds the goods MAR of 0.042 percent; for imports, the 0.055 percent services MAR equals the 0.055 percent goods MAR.

Table 8 also shows that revisions to income receipts exceed in magnitude revisions of exports and imports of goods and services. The ratio of the GDP-scaled MAR for income receipts to the MAR for exports of goods and services is $1.9 (= 0.126 \div 0.067)$. Similarly, the ratio of the MAR for income payments to the MAR for imports of goods and services is 1.5. In both cases, revisions to direct investment income flows account for more of the revisions to income flows than do revisions to other private income flows. For receipts, direct investment income revisions are 1.3 times as large, and for payments, direct investment income revisions are 1.7 times as large as revisions to other private income flows.

VI. Other Considerations for ITA Revisions

This section examines issues related to the ITA revisions including (1) the extent to which revisions to the seasonally adjusted estimates are driven by revisions to seasonal adjustment factors, as opposed to revisions to the seasonally unadjusted data, (2) whether MARs have systematically changed—that is, become larger or smaller—over time, and (3) the extent to which revisions made on the same date tend to be correlated and/ or of a common sign.

Revisions of seasonal adjustment factors

BEA publishes both seasonally adjusted and unadjusted ITA estimates. For trade in goods, the Census Bureau and BEA calculate seasonal factors; other accounts in the ITAs are seasonally adjusted by BEA. For seasonally ad-

justed ITA estimates, one source of revision is the revision to the seasonal adjustment factors. Each revision to a seasonally adjusted estimate can be decomposed into the revision to the corresponding seasonally unadjusted estimate and the revision to its seasonal adjustment factor. Given BEA's publication and revision schedule, the seasonal adjustment factors applied to the first estimates are based on seasonality detected in seasonally unadjusted estimates for years prior to the reference year. In the third estimates, the reference year's seasonally unadjusted quarterly data themselves become inputs into the seasonal adjustment procedure. For later revisions, adjustment factors account for seasonality in seasonally unadjusted estimates for years before, during, and after the year of the reference quarter. The relative impact on revisions to seasonal factors are likely greatest for the first-to-third revision. At the first-to-second horizon, seasonal factors are usually unrevised or minimally revised; at horizons past the third estimate, cumulative revisions resulting from new methods, new data sources, or definitions tend to be increasingly important.

Revisions to seasonal adjustment factors are important potential contributors to the overall magnitude of revisions. A 2003 study by BEA researchers using quarterly data covering 1990–2000 found "revisions to seasonal factors [to be] the principal determinants of the mean absolute revisions to the seasonally adjusted estimates of exports and imports of goods and services." However, the results of the 2003 study are not fully comparable with those of this study because the 2003 study examined growth rate revisions rather than item-value-scaled revisions.

Table 9 examines the impact of revisions to seasonal factors with item-value scaling. For item-value-scaled estimates, revisions to seasonal factors are relatively unimportant in explaining the overall MRs and MARs. For first-to-third MARs, changes to seasonal factors are

^{46.} Dennis J. Fixler, Bruce T. Grimm, and Anne E. Lee, "The Effects of Revisions to Seasonal Factors on Revisions to Seasonally Adjusted Estimates: The Case of Exports and Imports," Survey 83 (December 2003), 43–50: see page 43.

^{47.} A key characteristic of revisions due to changes in seasonal factors is that these revisions do not change the overall annual estimate; they simply reallocate transactions from one quarter to another. These changes often cause one quarter's dollar estimate to rise and that of an adjacent quarter to fall. Consequently, revisions to seasonal factors tend to exhibit negative autocorrelation. For instance, 9 of the 10 series shown in table 9 exhibit negative autocorrelation; the average correlation coefficient over these series is –0.18. For growth rate revisions, the effect is magnified, as growth rates are calculated by dividing the current quarter's dollar estimate by the prior quarter's dollar estimate and subtracting one. Any change to a dollar estimate affects growth rates in two adjacent quarters, but in different directions, as the dollar estimate is the numerator in the calculation of one quarter growth rate and the denominator in that of the prior quarter, exacerbating the negative correlation between revisions.

^{48.} By construction, the MR for seasonal factors will be very close to zero, as seasonal factors are constrained to leave the sum of four quarters of estimates for any given year unchanged.

much less important than revisions to seasonally unadjusted estimates for almost all accounts. Only for exports of goods (0.38 percent versus 0.41 percent for revisions to seasonally unadjusted estimates) and imports of goods (0.38 percent versus 0.23 percent) do seasonal factors play a relatively large role. For both of these accounts, the magnitudes of revisions to seasonally unadjusted estimates are very small. For both accounts, the revisions to the seasonally unadjusted estimates become larger in the first-to-latest revisions and the relative role of revisions to seasonal factors becomes smaller.

Trends in revisions

Chart 8 examines trends in the moving averages of revisions for six key accounts: three from the current account and three from the financial account, including the overall balances in both accounts. As the 1999-2011 period is relatively short, chart 8 includes an additional 10 years of revisions, so estimates from 1989–2011 are included in the analysis.⁴⁹ Because this analysis is applied to accounts in both the current account and the financial account, trend quarter-to-quarter absolute changes is used for scaling. The MRs and MARs are computed as 21-quarter weighted moving averages. Using moving averages rather than simple averages smooths the curves shown in the chart and mitigates the impact of the somewhat arbitrary choice of the number of quarters included in each average.⁵⁰ Each quarter's weighted average includes the revision associated with the quarter itself, along with revisions from the 10 preceding and the 10 succeeding quarters.⁵¹

Included in each panel is a 90 percent confidence interval. This is the interval bounded by the 5th and 95th percentile of a distribution of 21-observation-sample weighted means for both revisions (MRs) and absolute revisions (MARs) for a simulated baseline distribution.

The baseline distribution is constructed under the assumption that each revision is an independent random draw from a normal distribution with mean and standard deviation equal to those observed in the 92-quarter empirical distribution.⁵² Therefore, comparing the plotted data points to the confidence intervals can be interpreted as a test of whether any given 21-quarter subperiod has a different MR or MAR than the overall MR or MAR. Data points outside the confidence interval provide statistical evidence that the given subperiod's average is different from the overall average.

If there has been no change in the distribution of revisions from 1989 to 2011, approximately 10 percent of the points on each panel should lie outside the confidence interval bounds. In actuality, 23 percent of the MRs and 40 percent of the MARs are outside the

52. The 5th and 95th percentiles of the subperiod sample means were calculated by using the corresponding empirical percentiles from 100,000 simulated 21-observation samples. For the MR, direct algebraic calculation of these percentiles is feasible as the distribution of means is known. However, for the MAR, algebraic calculation is not straightforward, particularly as the average is a weighted, not a simple, average. For larger samples, a central-limit-theorem argument could be used to algebraically approximate these percentiles, but tests indicate that 21 observations is too few for the central limit theorem to apply in this case; the distribution of weighted MARs is right-skewed.

Calculated as the percentage point difference between the seasonally adjusted and seasonally unadjusted revisions.
 Norss. Revisions are computed as the ratio of the difference between later estimate and earlier estimate to

the earlier estimate and are expressed in percent terms.

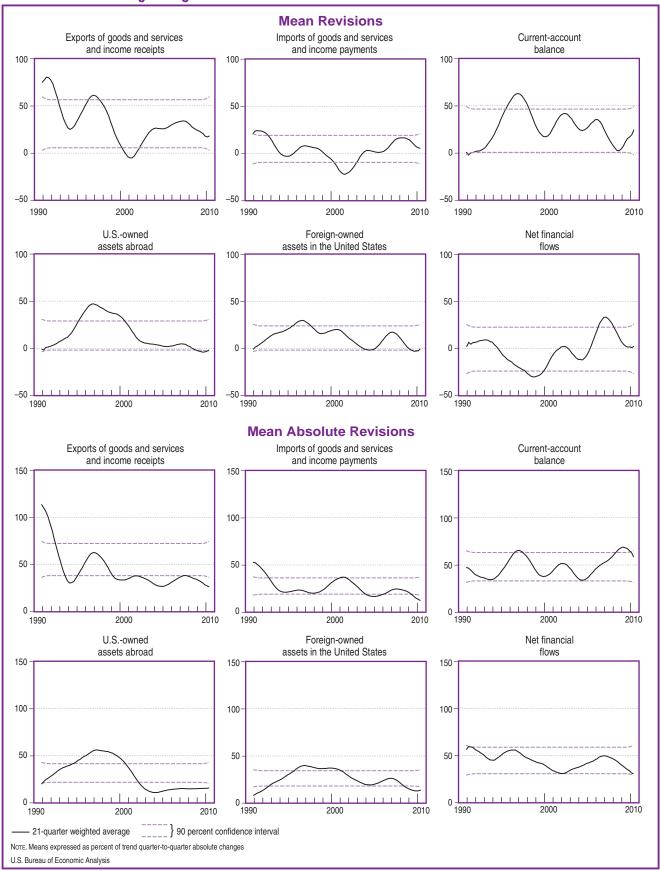

Natural signs used for revisions and estimates. See footnote 32 in the text.

^{49.} As noted in footnote 5, early vintage estimates extending this far back in time are not generally available electronically. These estimates were obtained from printed sources for the six accounts examined in this section.

^{50.} Using a weighted average with weights declining away from the central quarter means that an outlier on the edge of the averaged sample has only a small impact on the average. In contrast, the same outlier would have a much larger impact when a simple average is used. As a result, the simple average can vary much more strongly from quarter to quarter than the weighted average. A corollary is that changing the number of quarters used in the averages can be much more consequential for simple averages than for weighted averages.

^{51.} Because the weighting is somewhat arbitrary, using different weighting schemes may generate slightly different results. The weights are as follows for quarters at the indicated number of quarters remove from the reference quarter: 0, 9 percent; 1, 9 percent; 2, 8 percent; 3, 7 percent; 4, 6 percent; 5, 5 percent; 6, 4 percent; 7, 3 percent; 8, 3 percent; 9, 1 percent; 10, 0.5 percent. To add two more quarters in at the edge of this sample, the weighted average uses revisions from 19 quarters when revisions for the 10th preceding/succeeding quarter are not available, and uses revisions from 17 quarters when revisions for the 9th and 10th preceding/succeeding quarters are not available. The averages for these cases use the same relative weights as for the full 21-quarter cases, but absolute weights are scaled to equal 100 percent.

Chart 8. Revision Moving Averages

bounds. For exports of goods and services and income receipts and for U.S.-owned assets abroad, over 70 percent of the MARs are outside the bounds. For both of these accounts, the MAR and MR appear to have decreased, with that of exports of goods and services and income receipts decreasing early on and that of U.S.owned assets abroad decreasing near the middle of the period. For three of the other accounts, evidence of systematic change is weaker. There is some indication of decreases in the MARs of imports of goods and services and income payments early in the period as well as for foreign-owned assets in the United States, and of an increase in the MAR of the current-account balance recently.

Overall, the MRs and MARs of ITA estimates seem to fluctuate considerably. Neither peaks nor valleys are particularly long lived, and there is no common trend in MRs and MARs across accounts, although more seem to trend downward than upward. To the extent that there is any evidence of change in the distribution of revisions over time, this may reflect a number of factors including a change in source data quality for early estimates or changes in methodologies or definitions. Given that the evidence for change is weak and given that estimation-related changes have been numerous and complex over this period, it is not possible to isolate any specific event as being responsible for the observed trends.

Impact of annual ITA revisions

As noted earlier, the annual revisions of the ITAs occur each June. Although the first estimate of the first quarter of the contemporaneous reference year is also released at that time, the rest of the estimates released in June, and the only ones to which the term "revision" applies, are for earlier years. In almost every case, any estimate beyond the second estimate is released as part of the June annual revision. Thus, an "annual revision" is essentially synonymous with later estimates. This subsection identifies patterns that may be present in the annual revisions.

In principle, the first-to-third revisions to the four quarterly estimates for a given reference year, which are contained in the estimates released in the next year's annual revision, could be positively correlated, negatively correlated, or uncorrelated. For instance, if revisions to seasonal adjustment factors are the primary driver of the total revisions, there should be a negative relationship, as revising one quarter's factor up necessarily means that some other quarter's factor will be revised down. On the other hand, if revisions come primarily from newly available annual data that are distributed relatively evenly to each of the four quarters,

there would be a positive relationship among revisions.

Correlation coefficients for revisions to each quarter's estimates with revisions for other same-year quarters are shown in table 10. Like table 7, table 10 examines accounts from both the current account and financial account, so revisions are scaled by the trend value of absolute quarter-to-quarter changes. In large part, correlations are positive, but the strength of the correlation varies across quarters and accounts. For instance, there is stronger correlation in the current account in revisions than in the financial account.

A related, but broader, question is whether the "annual" revisions made on a given date for quarters from one reference year are correlated with the annual revisions made on the same date for quarters from another reference year. For instance, it might be that the June 2008 annual revision for some accounts results in higher estimates for all of the 16 quarters from 2004–2007, but the June 2009 annual revision results in lower estimates for all of these quarters. The 2008 and 2009 revisions may largely offset each other in the MR calculation, but the effect of each is correlated across multiple years of

Revisions made on a given date that apply new definitions or methods to an account's estimates will often move estimates in a common direction. Compared with a focus on revision vintages, a focus on revision dates highlights patterns from different types of revisions. For example, suppose that for some item, the largest influx of new source data is normally received too late for the second estimate but in time for the third estimate. The primary pattern observed would be by revision vintage: the second-to-third revision MAR

Table 10. Correlation of Revisions with Other Revisions to Quarters in Same Year, 1999-2011

^{*} Significant at p-values ≤ 0.05.
Noτε. Revisions are computed as the ratio of the difference between later estimate and earlier estimate to trend quarter-to-quarter changes in the latest estimate

would be larger than the first-to-second MAR. On the other hand, if a new definition is adopted, it will be imposed all at once in a given June when annual revisions are published. The primary pattern in this case would be by revision date: all (or most) revisions made that June would be in a common direction (either up or down). More generally, changes in methodologies and definitions should generate more distinct patterns in an analysis of revision dates, while the normal acquisition of updated source data may generate more distinct patterns in an analysis of revision vintages.

Table 11 presents information on directional patterns for June revisions for five key accounts. Several (25 of the 60) of the annual revisions change estimates for a given account in a common direction, as indicated by p-values less than 0.05. For example, the June 2011 annual revision increased estimates of exports of goods and services and income receipts in 47 out of the 48 quarters that were revised. If each of these 48 revisions were independent and just as likely to be upward as downward, there would be almost no chance of such a lopsided pattern, as indicated by the low p-value in

Table 11. Directional Patterns in June Revisions

^{1.} Given the null hypothesis that the estimates are equally likely to be revised up as revised down, the p-value represents the probability of seeing a) a ratio at least as high as the observed ratio, or b) a ratio with a reciprocal that is at least as high as the observed ratio. P-values below 0.05 in **bold**; between 0.05 and 0.1 in *italios*.

Note. Natural signs used for revisions and estimates. See footnote 32 in the text.

the fifth column of the table.⁵³ However, common direction changes are not spread equally throughout the accounts. More than half of the current-account p-values are less than 0.05, but only 4 of 24 of the financial-account p-values are below that threshold.

The adoption of new data and methods plays an important role in some common-direction revisions. For example, in June of 2007, 22 quarterly estimates of exports of goods and services and income receipts were revised upward. A substantial contribution to these revisions stemmed from instituting a new method for calculating bond interest; BEA changed to a currentyield method (reflecting only coupon interest flows) from a yield-to-maturity method (reflecting both coupon interest flows and future gains and losses on the security). As part of this change, BEA was able to use more detailed and precise survey data to replace the use of broad market indexes. This change resulted in higher yield estimates, which in turn led to higher estimates of income receipts extending back to the second half of 2001.

As a second example, in June of 2008, estimates of flows of U.S.-owned assets abroad were revised upward for 14 of the 16 quarters from 2004 to 2007. The revisions stemmed from two main sources. First, adjustments were made as a result of the 2006 Treasury Department benchmark survey to account for underreported source data on net U.S. purchases of foreign securities. The adjustments increased estimates of net purchases of foreign bonds. Second, methods for estimating missing source data on flows of short-term funds raised in U.S. markets by special purpose vehicles were improved. This increased "U.S. claims on unaffiliated foreigners reported by U.S. nonbanking concerns" from 2005 to 2007.

As noted earlier, ITA revisions are made for a number of reasons, including updated source data, new data sources, methodological improvements, and changes in definition. At the level of aggregation considered in this study, it is not possible quantitatively to assess the relative importance of each source of revision. For some accounts and for some time periods, source data updates are a major factor underlying observed MRs and MARs. For others, changes in definitions and methodologies are more important. The revisions summarized throughout this article reflect BEA's continuing efforts to improve its estimates to re-

flect new types of economic activities or new sources of data. In addition, revisions reflect BEA's efforts to ensure that its account categories reflect logical and useful classification frameworks.

VII. Revisions to Other International Accounts Estimates

This section briefly examines MRs and MARs of key estimates outside, but related to, the ITAs. These measures are presented for annual estimates of international investment position (IIP) accounts and the activities of multinational companies (MNCs).

IIP accounts

As stock measures, IIP estimates have a certain inertia not displayed by the corresponding flow estimates in the financial account of the ITAs, insofar as much of the stock from one year carries over to become part of the stock of the next year. Thus, the period-to-period variability of the IIP estimates, relative to the estimates themselves, is not as great as in the corresponding ITA financial-account transactions, suggesting that itemvalue-scaled MRs and MARs may not be large relative to other accounts.

Table 12 shows averages for the first-to-second revisions of six key components of the IIP accounts. Average absolute revisions of the estimates for 1989 to 2010 range in magnitude from 1.4 percent to 4.4 percent. MARs are larger on the U.S.-owned assets abroad side of the position and are associated with positive, although not statistically significant, MRs of similar size.⁵⁴ This finding raises a concern about possible persistent underestimation in the initial published estimates for U.S. holdings of assets in other countries. The MR for U.S. private assets varied over the sample period. Over the first half of the period, the MR was 5.1 percent; over the second half of the period, it was 2.1 percent. The difference in MRs between the first and second half of the period largely reflects the introduction into the estimates in 1997 of results from the Treasury Department survey of U.S. portfolio investment abroad as of March 1994, the first such benchmark survey in 50 years. The survey resulted in substantial revisions (nearly 13 percent) to the 1995 estimate. Since then, BEA's estimates of U.S. private assets have been reconciled with, and calibrated to, the Treasury Department's reinstituted benchmark survey and its more recently instituted annual survey on securities holdings.⁵⁵ As a result of this ongoing process, BEA's estimation methods and assumptions have improved.

^{53.} The p-values are based on a binomial distribution, where each revision can be considered a Bernoulli trial—an estimate is either revised upward or revised downward, with "success" probability of 0.5. The number of successes is the maximum of the number of upward revisions and the number of downward revisions. The number of Bernoulli trials is the sum of the two types of revisions. This statistical test does not allow for either an a priori imbalance of up and down revisions or any within-year clustering of the direction of revisions.

^{54.} None of the MRs shown in table 12 are statistically significant.

^{55.} BEA's estimates of foreign-owned assets in the United States show much smaller MRs. One reason is that Treasury Department surveys on liabilities in securities were in place throughout the period.

MNC activities

Table 12 also shows average revisions for estimates of selected MNC activities—employment, value added, and capital expenditures—for three types of entities: U.S parent companies, their foreign affiliates, and U.S. affiliates of foreign companies. These data are collected by BEA on benchmark and annual surveys. Due to data collection and analysis requirements, published estimates of MNC activities are necessarily less timely than ITA or IIP estimates, so the MRs and MARs cover years only through 2008. MARs range from less than 1 percent to nearly 3 percent. In general, revisions are largest for capital expenditures, an activity that is "lumpy" with large swings from one year to the next and therefore difficult to impute with precision (at the company level) before complete data are available.

Overall, the revisions of the estimates for both IIP accounts and the activities of MNCs are generally comparable with those of estimates in the current account. Revision magnitudes are generally low or moderate, and evidence of systematic underestimation may be

Table 12. Mean Revisions and Mean Absolute Revisions of First Annual Estimates in Selected Other International Accounts, Item-Value Scaling

explained by changes in data collection and verification procedures.

VIII. Conclusion

This study has presented the first indepth examination of the revisions of BEA's international accounts estimates. Revisions for most accounts center around zero and are small in magnitude. In addition, first estimates normally show the correct direction of change. For several of the main ITA aggregates, revisions are similar in magnitude to those of GDP, an estimate that has been the subject of multiple prior studies. Revisions to key balances, such as the current-account balance and the trade balance, are broadly similar to those of their component accounts.

The size of revisions differs across accounts. Revisions to goods exports and goods imports are considerably smaller, for instance, than revisions to income receipts and income payments. The method used to scale revisions influences the apparent size of the revisions. Whereas revisions in the financial account are quite large in dollar terms, when scaled by quarter-toquarter variability in the estimates, revisions in the financial account are relatively modest. Differences in the relative size of revisions across accounts can be largely explained by differences in the quality, timeliness, and variability of source data and by changes in the measurement of accounts over time.

BEA strives to ensure that its international accounts estimates are sufficiently timely to be relevant to policy and business decisions while presenting a comprehensive and accurate picture of interactions between the U.S. economy and the rest of the world. In large part, this involves efforts to improve source data coverage, both for the source data collected by BEA and in cooperation with partners such as the Treasury International Capital system, for source data obtained externally.⁵⁶ A primary focus of these efforts will continue to be ensuring that early estimates reflect the full range of relevant transactions.

All nonbank, majority-owned affiliates for 1989–2006; all majority-owned affiliates for 2007–2009.
 All nonbank affiliates for 1991; nonbank, majority-owned affiliates for all other years before 2007; all majority-owned affiliates for 2007–2009.

^{3.} All nonbank affiliates for 1989–1991 and 2000–2001; nonbank, majority-owned affiliates for all other years before 2007; all majority-owned affiliates for 2007–2009.

Nonbank parent companies.

Nonbank, majority-owned affiliates.
 Nore. Revisions are computed as the ratio of the difference between second annual estimate and first annual estimate to the first annual estimate and are expressed in percent terms.

^{56.} Several recent developments from the Treasury International Capital system should help to improve BEA's estimates, including more timely production of statistics on cross-border derivatives contracts (see www.federalregister.gov/ articles/2011/09/14/2011-23586/proposed-collections-comment-requests) and a new reporting form for cross-border securities position data (see Erika Brandner, Fang Cai, and Ruth Judson, "Improving the Measurement of Cross-Border Securities Holdings: The Treasury International Capital SLT," Federal Reserve Bulletin 98 (May 2012): 1-28.)

^{*}Joint release by the Census Bureau and the Bureau of Economic Analysis

D-2 November 2012

National Data

A. Selected NIPA Tables

The selected set of NIPA tables presents the most recent estimates of gross domestic product (GDP) and its components, which were released on October 26, 2012. These estimates include the advance estimates for the third quarter of 2012.

The selected set presents quarterly estimates that are updated monthly. Annual estimates are presented in most of the tables. Estimates for all NIPA series for 1929 forward are on BEA's Web site at www.bea.gov.

The GDP news release is available on BEA's Web site within minutes after the release. To receive an e-mail notification of the release, go to www.bea.gov and subscribe. The "Selected NIPA Tables" are available later that day.

Residual	26	20.2	-7.8	-10.6	-14.5	-24.3	-26.1	-29.1

Note. Chained (2005) dollar series are calculated as the product of the chain-type quantity index and the 2005 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Estimates for durable goods and nondurable goods for 1996 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).
 Includes government consumption expenditures, which are for services (such as education and national defense) produced by government. In current dollars, these services are valued at their cost of production.
 Some components of final sales of computers include computer parts.

Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.
 Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

Nore. Percent changes for real estimates are calculated from corresponding quantity indexes presented in NIPA tables 1.1.3, 1.2.3, 1.4.3, and 1.7.3. Percent changes in price estimates are calculated from corresponding price indexes presented in NIPA tables 1.1.4, 1.6.4, and 2.3.4.

^{1.} Estimates for durable goods and nondurable goods for 1996 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).

2. Includes government consumption expenditures, which are for services (such as education and national defense) produced by government. In current dollars, these services are valued at their cost of production.

3. Some components of final sales of computers include computer parts.

Note. Chained (2005) dollar series are calculated as the product of the chain-type quantity index and the 2005 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line following change in private inventories is the difference between gross domestic product and the sum of final sales of domestic product and of change in private inventories; the residual line following structures is the difference between gross domestic product and the sum of the detailed lines of goods, of services, and of structures.

Equals gross domestic product excluding gross value added of households and institutions and of general government.
 Equals gross domestic business value added excluding gross farm value added.
 Equals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving households, and rental income of persons for tenant-occupied houseing owned by nonprofit institutions.
 Equals compensation of general government employees plus general government consumption of fixed capital.

Equals gross domestic product excluding gross value added of households and institutions and of general government.
 Equals gross domestic business value added excluding gross farm value added.
 Equals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving households, and rental income of persons for tenant-occupied housing owned by nonprofit institutions.
 Equals compensation of general government employees plus general government consumption of fixed capital.

Equals gross domestic product excluding gross value added of households and institutions and of general government.
 Equals gross domestic business value added excluding gross farm value added.
 Equals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving households, and rental income of persons for tenant-occupied housing owned by nonprofit institutions.
 Equals compensation of general government employees plus general government consumption of fixed capital.

Equals gross domestic product excluding gross value added of households and institutions and of general government.
 Equals gross domestic business value added excluding gross farm value added.
 Equals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving households, and rental income of persons for tenant-occupied housing owned by nonprofit institutions.
 Equals compensation of general government employees plus general government consumption of fixed capital.

Note. Chained (2005) dollar series are calculated as the product of the chain-type quantity index and the 2005 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

^{2.} Equals gross domestic business value added excluding gross farm value added.

3. Equals compensation of employees of nonprofit institutions, the rental value of nonresidential fixed assets owned and used by nonprofit institutions serving households, and rental income of persons for tenant-occupied housing owned by nonprofit institutions.

nonprofit institutions.

4. Equals compensation of general government employees plus general government consumption of fixed capital.

Note. Chained (2005) dollar series are calculated as the product of the chain-type quantity index and the 2005 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
 Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
 Sexcludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
 Excludes software "embedded," or bundled, in computers and other equipment.

Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.

Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
 Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
 Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
 Excludes software "embedded," or bundled, in computers and other equipment.

^{1.} Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
4. The quantity index for computers can be used to accurately measure the real growth of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 1.5.2 and real growth rates are shown in table 1.5.1.
5. Excludes software "embedded," or bundled, in computers and other equipment.
Note. The residual line is the difference between the first line and the sum of the most detailed lines.

Excludes software "embedded," or bundled, in computers and other equipment.
 Some components of final sales of computers include computer parts.
 Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food

Gross domestic income deflated by the implicit price deflator for gross domestic product.
 Gross national income deflated by the implicit price deflator for gross national product.
 Net domestic income deflated by the implicit price deflator for net domestic product.

^{1.} Gross domestic income deflated by the implicit price deflator for gross domestic product.
2. Gross national income deflated by the implicit price deflator for gross national product.
3. Net domestic income deflated by the implicit price deflator for net domestic product.

NoTE. Except as noted in footnotes 1, 2 and 3, chained (2005) dollar series are calculated as the product of the chain-type quantity index and the 2005 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

Deflator is the gross domestic purchases price index.
 This measure is called "real gross domestic income" in the System of National Accounts, 2008.
 This measure is called "real gross national income" in the System of National Accounts, 2008.
 Deflator is the net domestic purchases price index.

Uses gross domestic purchases price index as deflator.
 This measure is called "real gross domestic income" in the System of National Accounts, 2008.
 This measure is called "real gross national income" in the System of National Accounts, 2008.
 Uses net domestic purchases price index as deflator.
 Ratio (multiplied by 100) of price index for gross domestic product to the price index for gross domestic purchases.

Ratio (multiplied by 100) of the price index for exports of goods and services to the price index for imports of goods and services.
 Ratio (multiplied by 100) of the price index for goods exports to the price index for goods imports.
 Ratio (multiplied by 100) of the price index for goods exports to the price index for nonpetroleum goods imports.

Estimates for financial corporate business and nonfinancial corporate business for 2000 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).

2. The current-dollar gross value added is deflated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.

3. Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 2005 current-dollar value of the corresponding series, divided by 100.

4. Chained-dollar net value added of nonfinancial corporate business is the difference between the gross product and the consumption of fixed capital. IVA Inventory valuation adjustment CCAdj Capital consumption adjustment

^{1.} The implicit price deflator for gross value added of nonfinancial corporate business divided by 100. Estimates for nonfinancial corporate business for 2000 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).

Nore. The current-dollar gross value added is deflated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.

IVA Inventory valuation adjustment

CCAdj Capital consumption adjustment

In this table, the net measures are the corresponding gross measures less the depreciation of fixed assets as measured by the consumption of fixed capital.
 Equals gross domestic purchases less change in private inventories.
 The command-basis estimates (lines 10-13) measure the purchasing power of the income generated by the sale of goods and services produced; they reflect gains or losses in real income resulting from changes in the terms of trade for exports and imports. For more detail on the command-basis measures, see NIPA tables 1.8.3 and 1.8.6.

Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
 Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
 Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
 Food consists of food and beverages purchased for off-premises consumption; food services, which include purchased meals and beverages, are not classified as food.
 Consists of gasoline and other energy goods and of electricity and gas services.
 Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

^{1.} Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
4. Food consists of food and beverages purchased for off-premises consumption; food services, which include purchased meals and beverages, are not classified as food.
5. Consists of gasoline and other energy goods and of electricity and gas services.
6. Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
 Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
 Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
 Food consists of load and beverages purchased for off-premises consumption; food services, which include purchased meals and beverages, are not classified as food.
 Consists of gasoline and other energy goods and of electricity and gas services.
 Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

1. Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
4. Food consists of food and beverages purchased for off-premises consumption; food services, which include purchased meals and beverages, are not classified as food.
5. Consists of gasoline and other energy goods and of electricity and gas.
6. Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

Note: Chained (2005) dollar series are calculated as the product of the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.
 Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).
 Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.
 Food consists of load and beverages purchased for off-premises consumption; food services, which include purchased meals and beverages, are not classified as food.
 Consists of gasoline and other energy goods and of electricity and gas.
 Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

^{1.} Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account

investment (construction and software).

2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

ment that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Note: Chained (2005) dollar series are calculated as the product of the chain-type quantity index and the 2005 current-dollar value of the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account

investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

^{1.} Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).
2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.
3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.
4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

^{1.} Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software in table 3.9.5.

Nors. Chained (2005) dollar series are calculated as the product of the chain-type quantity index and the 2005 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction and software).

and solivate).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account

Investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

^{4.} Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures and in software.
5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.
Note. Chained (2005) dollar series are calculated as the product of the chain-type quantity index and the 2005 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

^{1.} Exports and imports of certain goods, primarily military equipment purchased and sold by the federal government, are included in services. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to services.

2. Consists of capital transfers and the acquisition and disposal of nonproduced nonfinancial assets. Prior to 1982, reflects only capital grants paid to the U.S. territories and the Commonwealths of Puerto Rico and Northern Mariana Islands.

^{1.} Exports and imports of certain goods, primarily military equipment purchased and sold by the federal government, are included in services. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to

services.

2. Includes parts of foods, feeds, and beverages, of nondurable industrial supplies and materials, and of nondurable nonautomotive consumer goods.

are included in services. Beginning with 1986, repairs and alterations of equipment are replassing from 5000 to services.

2. The quantity index for computers can be used to accurately measure the real growth of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 4.2.2 and real growth rates are shown in table 4.2.1.

3. Includes parts of foods, feeds, and beverages, of nondurable industrial supplies and materials, and of nondurable accuratemative consumer ands.

^{3.} Includes parts of todds, feeds, and beverages, of nondurable industrial supplies and materials, and of nondurable nonauthomotive consumer goods.
Note: Chained (2005) dollar series are calculated as the product of the chain-type quantity index and the 2005 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. For exports and for imports, the residual line is the difference between the aggregate line and the sum of the most detailed lines.

Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.
 Excludes software "embedded", or bundled, in computers and other equipment.
 Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.
 Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oiffield machinery, service industry machinery, and electrical equipment not elsewhere classified.
 Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.
 Excludes net purchases of used structures and brokers' commissions on the sale of structures.

Trestuctification undures	29	209.4	203.2	200.0	210.3	203.0	200.0	234.4

^{1.} Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.

2. The quantity index for computers can be used to accurately measure the real growth rate of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 5.3.2 and real growth rates are shown in table 5.3.1.

3. Excludes software "embedded," or bundled, in computers and other equipment.

4. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.

5. Consists primarily of truntiture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.

6. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.

7. Excludes net purchases of used structures and brokers' commissions on the sale of structures.

Note: Chained (2005) dollar series are calculated as the product of the chain-type quantity index and the 2005 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

^{1.} This series is derived from the Census Bureau series "current cost inventories."
2. The inventory valuation adjustment (IVA) shown in this table differs from the IVA that adjusts business incomes. The IVA in this table reflects the mix of methods (such as first-in, first-out) underlying inventories derived primarily from Census Bureau statistics (see footnote 1). This mix differs from that underlying business income derived primarily from Internal Revenue Service statistics.

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

Chained (2005) dollar series for real change in private inventories are calculated as the period-to-period change in chained-dollar end-of-period inventories. Quarterly changes in end-of-period inventories are stated at annual rates. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Nonfarm inventories to final sales of goods and structures	29	4.58	4.57	4.58	4.51	4.52

^{1.} Inventories are as of the end of the quarter. The quarter to-quarter change in inventories calculated from current-dollar inventories in this table is not the current-dollar change in private inventories component of GDP. The former is the difference between two inventory stocks, each valued at its respective end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarterly rates, whereas, the change in private inventories is stated at annual rates.

2. Quarterly totals at monthly rates. Final sales of obmestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and imputed rental of owner-occupied nonfarm housing. It includes a small amount of final sales by farm and by government enterprises.

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and imputed rental of owner-occupied nonfarm housing. It includes a small amount of final sales by farm and by government enterprises.

Norz. Estimates in this table are based on the North American Industry Classification System (NAICS).

Chained (2005) dollar inventory series are calculated to ensure that the chained (2005) dollar change in inventories for 2005 equals the current-dollar change in inventories for 2005 and that the average of the 2004 and 2005 end-of-year chain-weighted and fixed-weighted inventories are equal.

^{1.} Consists of finance and insurance and bank and other holding companies.
2. Consists of credit intermediation and related activities; securities, commodity contracts, and other financial investments and related activities; insurance carriers and related activities; funds, trusts, and other financial vehicles; and bank and other holding companies.
3. Consists of wood products; normetallic mineral products; primary metals; other transportation equipment; furniture and related products; and miscellaneous manufacturing.
4. Consists of textile mills and textile product mills; apparel; leather and allied products; paper products; primary metals; other transportation equipment; furniture and related support activities; and plastics and rubber products.
5. Consists of agriculture, forestry, fishing, and hunting; mining; construction; real estate and rental and leasing; professional, scientific, and technical services; administrative and waste management services; educational services; health care and social assistance; arts, entertainment, and recreation; accommodation and food services; and other services, except government.

Note: Estimates in this table are based on the 2002 North American Industry Classification System (NAICS).

Sales of imported new autos ³	45	11.9	8.7	-18.3	24.7	60.9	-18.5	-4.4

Consists of used light trucks only.
 Consists of final sales and change in private inventories of new autos assembled in the United States.
 Consists of sales of imported new autos in personal consumption expenditures, in private fixed investment, and in gross government investment.

Consists of used light trucks only.
 Consists of final sales and change in private inventories of new autos assembled in the United States.
 Consists of sales of imported new autos in personal consumption expenditures, in private fixed investment, and in gross government investment.

Consists of used light trucks only.
 Consists of final sales and change in private inventories of new autos assembled in the United States.
 Consists of sales of imported new autos in personal consumption expenditures, in private fixed investment, and in gross government investment.
 Nors. Chained (2005) dollar series are calculated as the product of the chain-type quantity index and the 2005 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines, excluding the lines in the addenda.

1. Social security benefits include old-age, survivors, and disability insurance benefits that are distributed
from the federal old-age and survivors insurance trust fund and the disability insurance trust fund.
2. Medicare benefits include hospital and supplementary medical insurance benefits that are distributed from
the federal hospital insurance trust fund and the supplementary medical insurance trust fund.

Consists of nonmortgage interest paid by households.
 Equals disposable personal income deflated by the implicit price deflator for personal consumption expenditures.

^{5.} Population is the total population of the United States, including the Armed Forces overseas and the insti-tutionalized population. The monthly estimate is the average of estimates for the first of the month and the first of the following month; the annual estimate is the average of the monthly estimates.

November 2012 D-55

C. Historical Measures

This table is derived from the "Selected NIPA Tables" that are published in this issue and from the "GDP and Other Major NIPA Series" tables that were published in the August 2012 issue. (The changes in prices are calculated from indexes expressed to three decimal places.)

Table C.1. GDP and Other Major NIPA Aggregates—Continues

November 2012 D-59

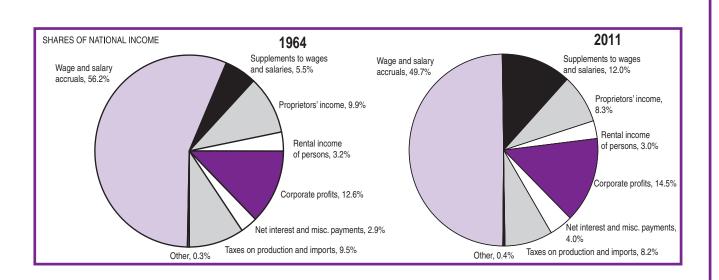

D. Charts

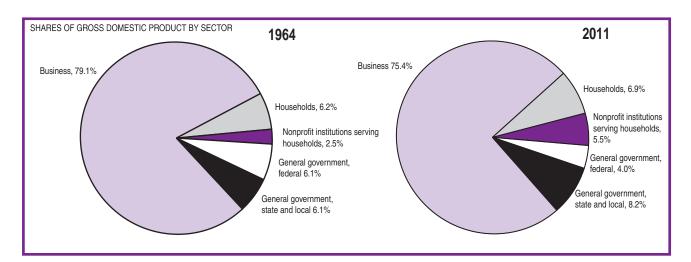

All series are seasonally adjusted at annual rates. The percent changes in real gross domestic product are based on quarter-to-quarter changes. The shaded areas mark the beginning and end of recessions as determined by the Business Cycle Dating Committee of the National Bureau of Economic Research.

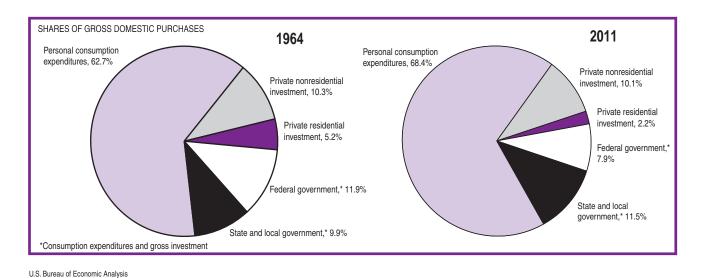

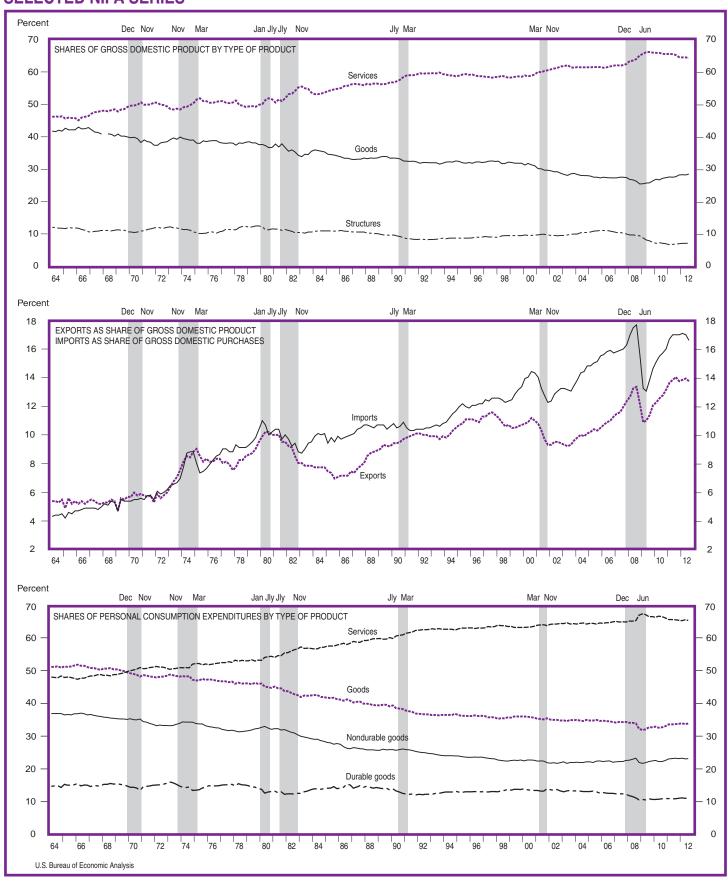

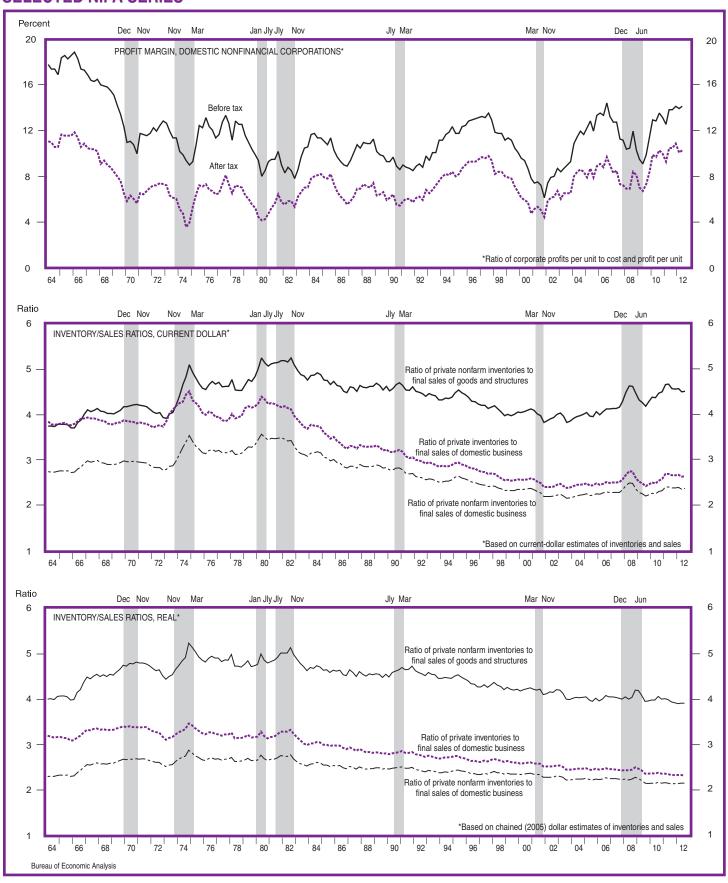

November 2012 D-65

Industry Data

E. Industry Table

The statistics in this table were published in tables 3a and 5a in "Annual Industry Accounts: Advance Statistics on GDP by Industry for 2011" in the May 2012 Survey of Current Business.

Table E.1. Percent Changes in Chain-Type Quantity and Price Indexes for Value Added by Industry for 2009–2011

Consists of agriculture, forestry, fishing, and hunting; mining; construction; and manufacturing.
 Consists of utilities; wholesale trade; retail trade; transportation and warehousing; information; finance, insurance, real estate, rental, and leasing; professional and business services; educational services, health care, and social

assistance; arts, entertainment, recreation, accommodation, and food services; and other services, except government.

3. Consists of computer and electronic products; publishing industries (includes software); information and data processing services; and computer systems design and related services.

D-66 November 2012

International Data

F. Transactions Tables

Selected U.S. international transactions tables are presented in this section. For BEA's full set of detailed estimates of U.S. international transactions, visit BEA's Web site at www.bea.gov.

p Preliminary
r Revised
1. Royalties and license fees and "other private services" by detailed type of service include both affiliated and unaffiliated transactions.
2. Includes royalties, license fees, and other fees associated with intangible assets, including patents, trade secrets, and other proprietary rights, that are used in connection with the production of goods.

Includes royalties, license fees, and other fees associated with copyrights, trademarks, franchises, rights to broadcast live events, software licensing fees, and other intellectual property rights.
 4. Other services receipts (exports) include mainly film and television tape rentals and expenditures of foreign residents temporarily working in the United States. Payments (imports) include mainly expenditures of U.S. residents temporarily working abroad and film and television tape rentals.
 5. These reflect the amount of premiums explicitly charged by, or paid to, insurers and reinsurers.

- Reflects changes in the value of the official gold stock due to fluctuations in the market price of gold.
 Reflects changes in gold stock from U.S. Treasury sales of gold medallions and commemorative and bullion coins; also reflects replenishment through open market purchases. These demonetizations/monetizations are not included in international transactions financial flows.

- international transactions financial flows.

 7. Also includes paid-in capital subscriptions to international financial institutions and outstanding amounts of miscellaneous claims that have been settled through international agreements to be payable to the U.S. government over periods in excess of 1 year. Excludes World War I debts that are not being serviced.

 8. Includes indebtedness that the borrower may contractually, or at its option, repay with its currency, with a third country's currency, or by delivery of materials or transfer of services.

 9. Includes foreign-currency-denominated assets obtained through temporary reciprocal currency arrangements between the Federal Reserve System and foreign central banks. These assets are included in the investment position at the dollar value established at the time they were received, reflecting the valuation of these assets in the Federal Reserve Systems balance sheet. The movement of exchange rates does not affect this valuation.

 10. Includes U.S. government liabilities associated with military sales contracts and U.S. government reserve-related liabilities from allocations of special drawing rights (SDRs).

p Preliminary r Revised * Less than \$500,000 (+/-)

^{..} Not applicable

Not applicable
 The presents gains or losses on foreign-currency-denominated assets and liabilities due to their revaluation at current exchange rates.
 Includes changes due to year-to-year shifts in the composition of reporting panels, primarily for bank and nonbank

estimates, and to the incorporation of more comprehensive survey results. Also includes capital glains and losses of direct investment affiliates and changes in positions that cannot be allocated to financial flows, price changes, or exchange-rate changes.

3. Financial flows and valuation adjustments for financial derivatives are available only on a net basis, which is shown

on line 2; they are not separately available for gross positive fair values and gross negative fair values of financial deriva-tives. Consequently, columns (a) through (d) on lines 4, 5, 24, and 25 are not available.

4. Data are not separately available for the three types of valuation adjustments; therefore, the sum of all three types is

shown in column (d).

D-78 November 2012

Regional Data

I. State and Regional Tables

The tables in this section include the most recent estimates of state personal income and gross domestic product by state. The sources of these estimates are noted.

The quarterly and annual estimates of state personal income and the estimates of gross domestic product by state are available online at www.bea.gov. For information on state personal income, e-mail reis@bea.gov; write to the Regional Economic Information System, BE-55, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230; or call 202-606-5360. For information on gross domestic product by state, e-mail gdpbystate@bea.gov; write to the Regional Product Division, BE-61, Bureau of Economic Analysis, U.S. Department of Commerce, Washington, DC 20230; or call 202-606-5340.

Table I.1. Personal Income by State and Region

[Millions of dollars, seasonally adjusted at annual rates]

p Preliminary r Revised

1. Percent change from preceding period was calculated from unrounded data.

Noτε. The personal income level shown for the United States is derived as the sum of the state estimates. It differs

from the estimate of personal income in the national income and product accounts because of differences in coverage, in the methodologies used to prepare the estimates, and the timing of the availability of source data.

Source: Table 1 in the "Regional Quarterly Report" in the October 2012 SURVEY OF CURRENT BUSINESS

Table I.2. Annual Personal Income and Per Capita Personal Income by State and Region

Note. Totals shown for the United States differ from the national income and product account statistics of gross domestic product (GDP) because GDP by state excludes and national GDP includes the compensation of federal civilian and military personnel stationed abroad and government consumption of fixed capital for military structures located abroad

and for military equipment, except office equipment. Also, GDP by state and national GDP have different revision schedules.

Source: This table reflects the GDP by state statistics for 2011 that were released on June 5, 2012.

D-82 November 2012

Total purposes.

Source: "Table 1. Personal Income and Per Capita Personal Income by Metropolitan Area, 2008–2010" in the May 2012 Survey of Current Business.

Per capita personal income was computed using Census Bureau midyear population estimates.
 Percent change was calculated from unrounded data.
 The personal income level shown for the United States is derived as the sum of the county estimates. It differs from the estimate of personal income in the national income and product accounts because of differences in coverage, in the methodologies used to prepare the estimates, and in the timing of the availability of source data.

^{4.} The metropolitan area definitions used by BEA for its personal income estimates are the county-based definitions issued by the Office of Management and Budget in June 2003 (with revisions released in February 2004, March 2005, December 2006, November 2007, November 2008, and December 2009) for federal statis-

A. Additional Information About the NIPA Estimates

Statistical Conventions

Current-dollar GDP is a measure of the market value of goods, services, and structures that are produced in the economy in a particular period. The changes in current-dollar GDP can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year—at present, the year 2005—equal to 100.¹

The annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from 2 adjacent years. For example, the annual percent change in real GDP for 2006-2007 uses prices for 2006 and 2007 as weights, and the 2006-2007 annual percent change in the GDP price index uses quantities for 2006 and 2007 as weights. Because the Fisher formula allows for the effects of changes in relative prices and in the composition of output over time, the resulting quantity or price changes are not affected by the substitution bias that is associated with changes in quantities and prices calculated using a fixed-weighted formula. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. The percent changes in the Fisher indexes are not affected by the choice of the reference year.

BEA also publishes implicit price deflators (IPDs), which are calculated as the ratio of the current-dollar value of a component to the chained-dollar value of the component, multiplied by 100. The values of an IPD are very close to the values of the corresponding "chain-type" price index.

The measures of real GDP and its major components are also presented in dollar-denominated form, designated "chained (2005) dollar estimates." For most series, these estimates are computed by multiplying the current-dollar value in 2005 by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 2005 and if real output for this component increased by 10 percent in 2006, then the chained (2005) dollar value of this component in 2006 would be \$110 ($$100 \times 1.10$). The percent changes calculated from the chained (2005) dollar estimates and from the quantity indexes are the same; any differences will be small and due to rounding.

The chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP (or to any intermediate aggregate) in a table, because the relative prices that are used as weights for any period other than the reference year differ from those of the reference year. A measure of the effect of such

differences is provided by a "residual" line—the difference between the chained-dollar value of the main aggregate in the table and the sum of the most detailed components in the table. For periods close to the reference year, when the relative prices that are used as weights have usually not changed much, the residuals tend to be small, and the chained-dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. For periods further from the reference year, the residuals tend to be larger, and the chained-dollar estimates are less useful for analyses of contributions to growth. In particular, for components for which relative prices are changing rapidly, the calculation of contributions based on chained-dollar estimates may be misleading even just a few years from the reference year. Thus, contributions derived from quantity indexes provide a better measure than contributions derived from chained-dollar estimates; contributions based on quantity indexes are shown in selected NIPA tables 1.1.2, 1.2.2, 1.5.2, 2.3.2, 3.9.2, 4.2.2, and 5.3.2.

For quarters and months, NIPA estimates are presented at annual rates, which show the value that would be registered if the rate of activity that is measured for a quarter or for a month were maintained for a full year. Annual rates are used so that periods of different lengths—for example, quarters and years—may be more easily compared. These annual rates are determined simply by multiplying the estimated rate of activity by 4 (for quarterly data) or by 12 (for monthly data).

For most quarterly NIPA estimates, *percent changes* in the estimates are also expressed at annual rates. Calculating these *changes* requires a variant of the compound interest formula:

$$r = \left[\left(\frac{x_t}{x_0} \right)^{m/n} - 1 \right] \times 100$$

where r is the percent change at an annual rate; x_t is the level of activity in the later period; x_0 is the level of activity in the earlier period; m is the periodicity of the data (for example, 1 for annual data, 4 for quarterly data, or 12 for monthly data); and n is the number of periods between the earlier periods and the later periods (that is, t-0).

Quarterly and monthly NIPA estimates are seasonally adjusted if necessary. Seasonal adjustment removes from the time series the average effects of variations that normally occur at about the same time and in about the same magnitude each year—for example, weather, holidays, and tax payment dates. After seasonal adjustment, cyclical and other short-term changes in the economy stand out more clearly.

B. Suggested Reading

The Bureau of Economic Analysis (BEA) has published a wealth of information about the methodologies that are used to prepare its national, industry, international, and regional accounts. Most of this information is available on BEA's Web site at www.bea.gov.

National accounts

The national accounts encompass the detailed estimates in the national income and product accounts (including gross domestic product) and the estimates of fixed assets and consumer durable goods.

National income and product accounts (NIPAs). This series of papers documents the conceptual framework of the NIPAs and the methodologies that are used to prepare the estimates. The first nine chapters have been updated to reflect the 2011 annual NIPA revision.

Concepts and Methods of the U.S. National Income and Product Accounts (2011)

"Introductory Chapters 1–4: Concepts, Source Data, and Estimating Methods"

"Chapter 5: Personal Consumption Expenditures"

"Chapter 6: Private Fixed Investment"

"Chapter 7: Change in Private Inventories"

"Chapter 8: Net Exports of Goods and Services"

"Chapter 9: Government Consumption Expenditures and Gross Investment"

"Chapter 10: Compensation of Employees" (2012)

"Chapter 13: Corporate Profits" (2012)

An Introduction to National Income and Product Accounts (2007)

Measuring the Economy: A Primer on GDP and the National Income and Product Accounts (2007)

The following Survey articles describe the 2009 comprehensive revision of the NIPAs.

"Initial Results of the 2009 Comprehensive NIPA Revision" (August 2009)

"Improved Estimates of the National Income and Product Accounts: Results of the 2009 Comprehensive Revision" (September 2009)

"Preview of the Revised NIPA Estimates for 2002: Effects of Incorporating the 2002 Benchmark I-O Accounts and Proposed Definition and Statistical Changes" (March 2008)

In addition, see the following articles.

"Annual Revision of the National Income and Product Accounts" (August 2012) presents revisions and describes any changes in the data and the methods used to prepare the estimates.

"Updated Summary of NIPA Methodologies" (November 2011) describes the source data and methods that are used to prepare the estimates.

"Chained-Dollar Indexes: Issues, Tips on Their Use, and Upcoming Changes" (November 2003) discusses the advantages of using chain-weighted indexes and the challenges of using chained dollars.

"Revisions to GDP, GDI, and Their Major Components" (July 2011) evaluates the principal NIPA estimates by examining the record of revisions to them.

"Gross Domestic Product: Revisions and Source Data" (February 2006) describes the categories of data that are used for the advance, preliminary (now called second), and final (now called third) quarterly estimates of GDP.

Fixed assets and consumer durable goods. Fixed Assets and Consumer Durable Goods in the United States, 1925–97 (2003) discusses the concepts and statistical considerations that underlie the estimates and their derivation.

"Fixed Assets and Consumer Durable Goods for 1997–2010" (September 2011) describes the improvements that were incorporated into these estimates as part of the 2011 annual NIPA revision.

Satellite account. This account extends the analytical capacity of the NIPAs by focusing on the effects of a particular aspect of economic activity on GDP.

"Research and Development Satellite Account"

For 1959–2002 (December 2006)

For 1959–2004 (October 2007)

For 1959–2007 (December 2010)

Mission Statement and Strategic Plan

The mission statement of the Bureau of Economic Analysis and its most recently updated strategic plan for improving the accuracy, reliability, and relevance of the national, industry, regional, and international accounts are available on BEA's Web site at www.bea.gov under "About BEA."

Industry accounts

The industry accounts consist of the annual industry accounts (the input-output accounts and the gross domestic product by industry accounts), the benchmark input-output accounts, and two satellite accounts.

Annual industry accounts. Measuring the Nation's Economy: An Industry Perspective (2011) provides an overview of these accounts and how they can be used to examine industry activity in the U.S. economy and to track the flow of goods and services throughout the economy.

Benchmark input-output accounts. *Concepts and Methods of the U.S. Input-Output Accounts* (September 2006) describes the concepts and methods that underlie the preparation of these accounts.

Satellite accounts. These accounts extend the analytical capacity of the input-output accounts by focusing on a particular aspect of economic activity.

"U.S. Travel and Tourism Satellite Accounts"

For 2005–2008 (June 2009)

For 2004–2009 (November 2010)

For 2007–2010 (June 2011)

For 2003-2011 (June 2012)

International accounts

The international accounts encompass the international transactions accounts and the international investment position accounts, direct investment, and international transactions in services.

International transactions accounts and international investment position accounts. "A Guide to the U.S. International Transactions Accounts and the U.S. International Investment Position Accounts" (February 2010) introduces these accounts.

U.S. International Transactions Accounts: Concepts and Estimation Methods (2011) describes the methodologies used to prepare the estimates. The methodology is usually updated and improved as part of the annual revisions of the international transactions accounts. The updated and improved methodology is described in a series of articles, the latest of which was published in the July 2012 Survey.

"Modernizing and Enhancing BEA's International Economic Accounts: A Progress Report" (May 2012) updates BEA's plans to introduce the new international statistical standards from recently updated manuals and its plans for changes that were included in the 2011 annual revision.

Direct investment. Updated methodologies are

available in U.S. Direct Investment Abroad: Final Results From the 2004 Benchmark Survey (2008) and in Foreign Direct Investment in the United States: Final Results From the 2002 Benchmark Survey (2006).

Additional improvements are described in the following annual articles: "Direct Investment Positions: Country and Industry Detail" (July) and "Operations of U.S. Multinational Companies" (November 2011) and "Operations of U.S. Affiliates of Foreign Companies" (August 2012).

International services. The methodology used to prepare the estimates is usually updated and improved in a series of articles, the latest of which was published in the October 2012 Survey.

"Selected Issues in the Measurement of U.S. International Services" (June 2002) describes key issues in defining and measuring insurance, wholesale and retail trade, finance, construction, and utilities services.

Regional accounts

The regional accounts include estimates of personal income and gross domestic product.

Personal income. Estimates of personal income are prepared for states and for local areas.

State Personal Income and Employment (2011) describes the detailed methodology that is used to prepare the quarterly and annual estimates for the states, the District of Columbia, the eight BEA regions, and the United States.

Local Area Personal Income and Employment (2011) describes the detailed methodology that is used to prepare the estimates for counties, metropolitan areas, metropolitan divisions, micropolitan areas, combined statistical areas, and BEA economic areas and regions.

Gross domestic product. Estimates of gross domestic product (GDP) are prepared for states and metropolitan areas.

Gross Domestic Product by State (2006) describes the sources and the methods that are used to prepare the estimates.

"Gross Domestic Product by State" (December 2010) presents the results of the most recent comprehensive revision.

"Introducing New Measures of the Metropolitan Economy: Prototype Estimates of GDP by Metropolitan Area" (November 2007) describes the potential uses of the estimates.
