U.S. Travel and Tourism Satellite Accounts. Updated output, employment, and other statistics for travel and tourism for 2010–2015.

Director's Message

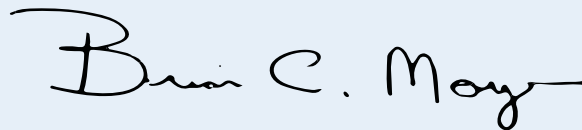

The rising importance of information and communications technologies (ICT) in international trade has sparked heightened interest in measuring such trade. In this issue, we present statistics on U.S. trade in ICT services and potentially ICT-enabled services for 1999–2014. In keeping with the Bureau of Economic Analysis (BEA) mission, these statistics promote a better understanding of how U.S. companies engaged in services trade are reaching global markets.

In addition, a *BEA Briefing* discusses a project involving BEA, the National Science Foundation, and the Census Bureau to link data from key surveys to provide new statistics on multinational enterprises (MNEs) located in the United States that engage in both research and development (R&D) and international trade in innovation-related services. The data show that employment by these MNEs is more R&D-intensive than that of MNEs that perform R&D but do not engage in innovation-related services trade.

A *Research Spotlight* discusses the use of a new economic accounting framework to describe the production and sourcing patterns for different types of firms within specific industries. The estimates show that for globally engaged firms, domestic value added as a share of output tends to be lower, compared with domestically oriented firms, while exports and imports of goods as a share of output tend to be higher.

Also, please note that next month, BEA will release the results of the 2016 annual revisions of the U.S. international transactions accounts and the U.S. international investment position accounts. A short preview article discusses the key changes and how they will improve the accounts.

Elsewhere, we note the advance gross domestic product statistics for the first quarter of 2015.

Brian C. Moyer
Director, Bureau of Economic Analysis

Taking Account...

BEA working paper analyzes SPEs

Official statistics on international trade and investment typically include transactions within multinational enterprises (MNEs) and positions on foreign direct investment (FDI). In the interpretation and use of these important statistics, the role of special purpose entities (SPEs) has long been a complicating factor.

In contrast to operating entities, SPEs generally have few or no employees, little or no physical presence, and little or no production or economic activity. Examples of SPEs include finance and holding companies, royalty and licensing companies, leasing companies, and securitization vehicles.

Widely followed international guidelines generally recommend that transactions with SPEs and positions in SPEs be included in official statistics. However, the guidelines also recommend that supplemental information be provided to better understand the role of SPEs and the passthrough nature of their transactions.

BEA's international accounts and national accounts do not provide statistics on inbound direct investment via foreign-sponsored SPEs in the United States (resident SPEs) or on outbound direct investment for U.S.-sponsored SPEs in foreign countries (nonresident SPEs).

Given the U.S. regulatory environment and other factors,

passthrough activities associated with resident SPEs of foreign MNEs is relatively small. In contrast, data collected on foreign affiliates of U.S. MNEs suggest the impact of nonresident SPEs on outbound FDI is significant. Thus, a distinction between SPEs and operating entities on U.S. direct investment abroad is worthy of consideration.

A recent paper by Dylan Rassier, an economist at the Bureau of Economic Analysis (BEA), presents a statistical analysis of various characteristics of nonresident SPEs. Rassier's paper relies on survey data collected by BEA on MNEs (based on financial statements), including data on U.S. parents and their majority-owned foreign affiliates reported for the 2009 Benchmark Survey of U.S. Direct Investment Abroad.

A majority-owned foreign affiliate is an affiliate in which the combined direct and indirect ownership interest of the U.S. parent is more than 50 percent. A parent is defined as a person with a direct or indirect investment of 10 percent or more in a foreign business enterprise.

The analysis includes a univariate approach that focuses on mean comparison tests of characteristics of SPE affiliates and their operating entity counterparts and includes a multivariate approach that focuses on comparing coefficient estimates from regressions of reported sales on value added and its

components across SPE affiliates and operating entity affiliates.

The paper marks a rare effort to analyze nonresident SPEs from a microeconomics perspective.

The results reveal a large number of nonresident SPEs sponsored by U.S. MNEs that are not isolated in a few industries or a single global region.

Significant differences exist between SPE affiliates and operating entity affiliates in their balance sheet components and in their income statement components, the paper notes.

Significant differences also result for measured value added. In particular, variation in measured value added does not appear to generate adequate variation in consequent sales for SPE affiliates, which implies value added is over attributed to SPE affiliates.

Moreover, the lack of variation is most evident in the profits component of value added, which is consistent with previous research by others using aggregate statistics on the activities of MNEs. Given the pattern demonstrated in the microdata, measured production attributed to SPE affiliates in supplemental statistics appears to be incongruent with reported economic activity.

(This summary of the working paper was prepared by the SURVEY OF CURRENT BUSINESS staff in conjunction with the paper's author. The paper is available on the [BEA Web site](#).)

Real GDP Overview

Table 1. Real Gross Domestic Product (GDP) and Related Measures

[Seasonally adjusted at annual rates]

	Share of current-dollar GDP (percent)	Change from preceding period (percent)				Contribution to percent change in real GDP (percentage points)

1. The estimates of GDP under the contribution columns are also percent changes.

2. GDI is deflated by the implicit price deflator for GDP.

NOTE: Percent changes are from NIPA tables 1.1.1 and 1.2.1, contributions are from NIPA tables 1.1.2 and 1.2.2, and shares are from NIPA table 1.1.10, or they are calculated from NIPA table 1.2.5.

The slowdown in real GDP in the first quarter reflected a larger decrease in nonresidential fixed investment, a slowdown in consumer spending, a downturn in federal government spending, an upturn in imports, and larger decreases in private inventory investment and in exports that were partly offset by an upturn in state and local government spending and a pickup in residential fixed investment.

The slowdown in consumer spending reflected slowdowns in spending for both goods and services.

Within goods, the main contributors to the slowdown were a larger decrease in motor vehicles and parts (primarily new motor vehicles) and a downturn "other" nondurable goods (mainly pharmaceutical and other medical products).

The slowdown in services primarily reflected slowdowns in recreational services, in food services and accommodations, and in spending by nonprofit institutions serving households that were partly offset by an upturn in spending for electricity and gas.

The larger decrease in nonresidential fixed investment reflected larger decreases in equipment and in structures.

The larger decrease in structures was mainly attributable to a larger decrease in mining exploration, shafts, and wells, the largest for this series and the fifth consecutive quarterly decrease.

The larger decrease in equipment investment was primarily attributable to downturns in industrial equipment and in information processing equipment (mainly communication equipment).

The pickup in residential fixed investment reflected pickups in "other" structures (mainly brokers commissions) and in multifamily structures that were partly offset by a slowdown in single-family structures.

The larger decrease in inventory investment primarily reflected a larger decrease in nonfarm inventory investment.

The larger decrease in exports reflected a downturn in services that was partly offset by a smaller decrease in goods.

The upturn in imports reflected a smaller decrease in goods imports and a pickup in services imports.

The downturn in federal government spending primarily reflected a downturn in defense spending.

The upturn in state and local government spending was primarily accounted for by an upturn in investment in structures.

Prices

Table 2. Prices for Gross Domestic Purchases

[Percent change at annual rates; based on seasonally adjusted index numbers (2009=100)]

	Change from preceding period (percent)				Contribution to percent change in gross domestic purchases prices (percentage points)

State and local	1.4	1.0	-0.4	-0.8	0.15	0.10	-0.04	-0.09
Addenda:								
Gross domestic purchases:								
Food	-1.2	2.1	-0.3	-1.7	-0.06	0.10	-0.02	-0.09
Energy goods and services	15.1	-1.2	-17.0	-30.1	0.42	-0.04	-0.53	-0.96
Excluding food and energy	1.2	1.3	1.0	1.4	1.14	1.20	0.91	1.31
Personal consumption expenditures (PCE):								
Food and beverages purchased for off-premises consumption	-1.1	2.2	0.0	-1.8
Energy goods and services	15.1	-1.9	-17.2	-30.3
Excluding food and energy	1.9	1.4	1.3	2.1
Gross domestic product (GDP)	2.1	1.3	0.9	0.7
Exports of goods and services	-1.0	-4.1	-5.5	-5.6
Imports of goods and services	-4.2	-3.5	-7.5	-7.5

1. The estimates of gross domestic purchases under the contribution columns are also percent changes. NOTE: Most percent changes are from NIPA table 1.6.7; percent changes for PCE for food and energy goods and services and for PCE excluding food and energy are from NIPA table 2.3.7. Contributions are from NIPA table 1.6.8. GDP, export, and import prices are from NIPA table 1.1.7.

Prices paid by U.S. residents, as measured by the gross domestic purchases price index, increased 0.3 percent in the first quarter after increasing 0.4 percent in the third quarter. The slowdown primarily reflected a larger decrease in the prices paid for consumer spending on nondurable goods, a slowdown in the prices paid for nonresidential fixed investment, and a larger decrease in prices paid by state and local governments.

The larger decrease in the prices paid for nondurable goods primarily reflected a larger decrease gasoline and other energy goods.

The slowdown in prices paid for nonresidential fixed investment primarily reflected a larger decrease in the prices paid for investment in structures and a slowdown in the prices paid for investment in intellectual property products that were partly offset by a pickup in the prices paid for equipment.

The larger decrease in the prices paid by state and local governments reflected larger decreases in the prices paid for investment in structures and in the prices paid for consumption expenditures.

Consumer prices excluding food and energy, a measure of the “core” rate of inflation, picked up, increasing 2.1 percent after increasing 1.3 percent.

Note on Prices

BEA’s gross domestic purchases price index is the most comprehensive index of prices paid by U.S. residents for all goods and services. It is derived from the prices of personal consumption expenditures (PCE), private investment, and government consumption expenditures and gross investment.

BEA also produces price indexes for all the components of GDP. The PCE price index is a measure of the total cost of consumer goods and services, including durable goods, nondurable goods, and services. PCE prices for food, for energy goods and services, and for all items except food and energy are also estimated and reported.

Because prices for food and for energy can be volatile, the

price measure that excludes food and energy is often used as a measure of underlying, or “core,” inflation. The core PCE price index includes purchased meals and beverages, such as restaurant meals and pet food. (See the FAQ “[What is the core PCE price index?](#)” on BEA’s Web site.)

BEA also prepares a supplemental PCE price index, the “market-based” PCE price index, that is based on market transactions for which there are corresponding price measures. This index excludes many imputed expenditures, such as financial services furnished without payment, that are included in PCE and in the PCE price index. BEA also prepares a market-based measure that excludes food and energy.

Personal Income

ACA Affordable Care Act
IVA Inventory valuation adjustment

CCAdj Capital consumption adjustment

Personal income, which is measured in current dollars, picked up in the first quarter, increasing \$130.8 billion after increasing \$117.4 billion in the fourth quarter. The pickup primarily reflected an upturn in personal interest income and a pickup in government social benefits to persons that were partly offset by a downturn in personal dividend income.

The upturn in personal interest income primarily reflected the pattern of interest paid on Treasury Inflation-Protected Securities, which is mostly based on data from the Treasury Department.

The pickup in government social benefits to persons primarily reflected an upturn in "other social benefits to persons (mainly refundable tax credits).

Personal current taxes slowed, reflecting a slowdown in state and local taxes.

Disposable personal income, measured as personal income less personal current taxes, picked up in the first quarter, increasing \$106.5 billion after increasing \$89.0 billion in the fourth quarter.

Personal saving—disposable personal income less personal outlays—increased \$33.9 billion in the first quarter to \$712.3 billion after decreasing \$1.9 billion in the fourth quarter.

The personal saving rate was 5.2 percent in the first quarter; in the fourth quarter, the rate was 5.0 percent.

Chart 2. Personal Saving Rate

1. Assumption.

Source Data and Key Assumptions for the Advance Estimates of GDP

The advance estimates of many components of GDP are based on 3 months of source data, but the estimates of some components are based on only 2 months of data. For the following items, the number of months for which data are available is shown in parentheses.

Consumer spending: sales of retail stores (3), unit auto and truck sales (3), consumers' shares of auto and truck sales (2), motor vehicle fuels data (3), and electricity and gas usage and unit-value data (3);

Nonresidential fixed investment: unit auto and truck sales (3), construction spending (value put in place) (2), manufacturers' shipments of machinery and equipment (3), and exports and imports of machinery and equipment (3);

Residential fixed investment: construction spending (value put in place) (2), single-family housing starts (3), sales of new homes (3), and sales of existing houses (3);

Inventory investment: trade and nondurable-goods manufacturing inventories (2), durable-goods manufacturing inventories (3), and unit auto and truck inventories (3);

Net exports of goods and services: exports and imports of goods (3) and services (2) and values and quantities of petroleum imports (3);

Government spending: federal government outlays (3),

state and local government construction spending (value put in place) (2), and state and local government employment (3);

Compensation: employment, average hourly earnings, and average weekly hours (3); and

Prices: consumer price indexes (3), producer price indexes (3), and values and quantities of petroleum imports (3).

Key assumptions

When source data were unavailable, BEA made various assumptions from February to March, including the following (table 4):

- An increase in nonresidential structures,
- An increase in single-family structures,
- An increase in multifamily structures,
- A decrease in nondurable-goods manufacturing inventories,
- An increase in nonmotor vehicle merchant wholesale and retail inventories, and
- An increase in state and local government structures.

A more comprehensive list is available on BEA's Web site.

Preview of the Upcoming Annual NIPA Revision

On July 29, 2016, the Bureau of Economic Analysis (BEA) will release the results of the annual revision of the national income and product accounts (NIPAs) together with the advance estimate of gross domestic product (GDP) for the second quarter of 2016. The revision will cover the most recent 3 years (2013 through 2015) and the first quarter of 2016. The reference year for index numbers and chained-dollar estimates will remain 2009.

Regular source data updates. The annual revision will incorporate the usual annual source data for 2013 through 2015 that are more complete and more detailed than those previously available, including the following:

- Census Bureau data from the annual surveys of manufactures, of merchant wholesale trade, of retail trade, of services, and of state and local governments;
- Federal government budget data;
- Internal Revenue Service tabulations of tax returns for corporations and for sole proprietorships and partnerships; and
- Department of Agriculture farm income statistics.

Newly available source data and other refinements. Additionally, the revision will incorporate the following newly available source data and refinements to BEA's methods:

- Beginning with the advance estimate of GDP for the second quarter of 2016, BEA expects to incorporate newly available Census Bureau data on wholesale and

retail trade inventories that are scheduled to be released in time for the advance estimates of the NIPAs. BEA currently estimates inventories for the quarter based on Census Bureau-reported inventory data for the first two months of the quarter and BEA assumptions for the third month. The scheduled accelerated release of these data by the Census Bureau will allow BEA to calculate a more accurate estimate of the change in private inventories component of GDP for the advance estimate.

- In November 2015, the Census Bureau released revised monthly estimates of construction spending for January 2005 through October 2015. BEA uses these data to prepare annual estimates of private fixed investment for residential structures. For the upcoming revision, BEA will incorporate revised Census Bureau data into its annual estimates of residential improvements for 2013 through 2015. Estimates for earlier years will be revised during a future revision of the NIPAs. For details, see the FAQ [“How will the revised Census Bureau construction spending data affect BEA's quarterly and annual estimates of private fixed investment?”](#)
- As part of its regular review and update of seasonal adjustment factors, BEA will continue to refine or improve its seasonal adjustments for several GDP components. For more information, see the FAQ [“How does BEA account for seasonality in GDP?”](#)

27	Residual	-35.1	-46.0	-40.8	-44.6	-48.9	-49.8	-39.0

Legend / Footnotes:

Note. Chained (2009) dollar series are calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

42	Market-based PCE excluding food and energy ⁴	1.1	1.1	1.1	1.2	1.5

Legend / Footnotes:

1. Final sales to domestic purchasers less government consumption expenditures and gross investment.

2. The arithmetic average of gross domestic product and of gross domestic income, deflated by the implicit price deflator for GDP.

3. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

4. Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

Note. Percent changes for real estimates are calculated from corresponding quantity indexes presented in NIPA tables 1.1.3, 1.2.3, 1.4.3, and 1.7.3. Percent changes in price estimates are calculated from corresponding price indexes presented in NIPA tables 1.1.4, 1.6.4, and 2.3.4.

Legend / Footnotes:

1. Prior to 1959, inventories held by construction establishments are included in nondurable goods. Beginning with 1959, these inventories are included in durable goods. Estimates for durable goods and nondurable goods for 1996 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).

2. Includes government consumption expenditures, which are for services (such as education and national defense) produced by government. In current dollars, these services are valued at their cost of production.

3. Some components of final sales of computers include computer parts.

Legend / Footnotes:

1. Prior to 1959, inventories held by construction establishments are included in nondurable goods. Beginning with 1959, these inventories are included in durable goods. Estimates for durable goods and nondurable goods for 1996 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).

2. Includes government consumption expenditures, which are for services (such as education and national defense) produced by government. In current dollars, these services are valued at their cost of production.

3. Some components of final sales of computers include computer parts.

Note. Chained (2009) dollar series are calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line following change in private inventories is the difference between gross domestic product and the sum of final sales of domestic product and of change in private inventories; the residual line following structures is the difference between gross domestic product and the sum of the detailed lines of goods, of services, and of structures.

8	Final sales to private domestic purchasers ¹	14,648.8	15,183.3	14,924.1	15,126.3	15,294.3	15,388.4	15,446.5

Legend / Footnotes:

1. Final sales to domestic purchasers less government consumption expenditures and gross investment.

Table 1.4.6. Relation of Real Gross Domestic Product, Real Gross Domestic Purchases, and Real Final Sales to Domestic Purchasers, Chained Dollars

[Billions of chained (2009) dollars] Seasonally adjusted at annual rates

Last Revised on: April 28, 2016 - Next Release Date May 27, 2016

Line		2014	2015	2015				2016
				I	II	III	IV	I
1	Gross domestic product	15,961.7	16,348.9	16,177.3	16,333.6	16,414.0	16,470.6	16,492.7
2	Less: Exports of goods and services	2,086.4	2,110.1	2,091.4	2,117.5	2,121.1	2,110.3	2,096.7
3	Plus: Imports of goods and services	2,528.9	2,653.5	2,632.5	2,652.1	2,667.2	2,662.2	2,663.3
4	Equals: Gross domestic purchases	16,405.8	16,894.7	16,720.8	16,870.7	16,962.4	17,025.0	17,061.2
5	Less: Change in private inventories	68.0	97.5	112.8	113.5	85.5	78.3	60.9
6	Equals: Final sales to domestic purchasers	16,326.3	16,788.3	16,597.7	16,747.2	16,868.3	16,940.0	16,989.9
	Addenda:							
7	Final sales of domestic product	15,881.7	16,241.9	16,053.8	16,209.7	16,319.3	16,385.0	16,420.7
8	Final sales to private domestic purchasers ¹	13,497.7	13,940.8	13,770.1	13,901.6	14,010.1	14,081.2	14,122.8

Legend / Footnotes:

1. Final sales to domestic purchasers less government consumption expenditures and gross investment.

Note. Chained (2009) dollar series are calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

63	Residual	-62.6	-82.6	-74.2	-78.4	-86.1	-91.8	-88.2

Legend / Footnotes:

1. Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.

2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).

3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.

4. The quantity index for computers can be used to accurately measure the real growth of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 1.5.2 and real growth rates are shown in table 1.5.1.

5. Excludes software embedded, or bundled, in computers and other equipment.

6. Research and development investment excludes expenditures for software development. Software development expenditures are included in software investment on line 38.

Note. The residual line is the difference between the first line and the sum of the most detailed lines.

Legend / Footnotes:

1. Prior to 1959, current surplus of government enterprises (line 22) is not shown separately; subsidies are included net of the current surplus of government enterprises in line 18.

2. The arithmetic average of gross domestic product and of gross domestic income.

3. Consists of compensation of employees, proprietors' income with inventory valuation adjustment (IVA) and capital consumption adjustment (CCAdj), rental income of persons with CCAdj, corporate profits with IVA and CCAdj, net interest and miscellaneous payments, and consumption of fixed capital.

4. Consists of gross national factor income less consumption of fixed capital.

1. Gross domestic income deflated by the implicit price deflator for gross domestic product.
2. The arithmetic average of gross domestic product and of gross domestic income, deflated by the implicit price deflator for GDP.
3. Gross national income deflated by the implicit price deflator for gross national product.
4. Net domestic income deflated by the implicit price deflator for net domestic product.

Note. Except as noted in footnotes 1, 2 and 3, chained (2009) dollar series are calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive.

Legend / Footnotes:

1. Estimates for financial corporate business and nonfinancial corporate business for 2000 and earlier periods are based on the 1987 Standard Industrial Classification (SIC); later estimates for these industries are based on the North American Industry Classification System (NAICS).

2. The current-dollar gross value added is deflated using the gross value added chain-type price index for nonfinancial industries from the GDP-by-industry accounts. For periods when this price index is not available, the chain-type price index for GDP goods and structures is used.

Table 1.14. Gross Value Added of Domestic Corporate Business in Current Dollars and Gross Value Added of Nonfinancial Domestic Corporate Business in Current and Chained Dollars

[Billions of dollars] Seasonally adjusted at annual rates

Last Revised on: April 28, 2016 - Next Release Date May 27, 2016

3. *Chained-dollar consumption of fixed capital of nonfinancial corporate business is calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100.*

4. *Chained-dollar net value added of nonfinancial corporate business is the difference between the gross product and the consumption of fixed capital.*

42	Disposable personal income, chained (2009) dollars	2.7	3.4	3.9	2.6	3.2	2.3	2.9

Legend / Footnotes:

1. Includes actual employer contributions and actuarially imputed employer contributions to reflect benefits accrued by defined benefit pension plan participants through service to employers in the current period.
2. Social security benefits include old-age, survivors, and disability insurance benefits that are distributed from the federal old-age and survivors insurance trust fund and the disability insurance trust fund.
3. Medicare benefits include hospital and supplementary medical insurance benefits that are distributed from the federal hospital insurance trust fund and the supplementary medical insurance trust fund.
4. Consists of nonmortgage interest paid by households.
5. The current-dollar measure is deflated by the implicit price deflator for personal consumption expenditures.

28	Market-based PCE excluding food and energy ⁶	3.1	3.6	1.7	4.1	3.3	3.1	1.1

Legend / Footnotes:

1. Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.

2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).

3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.

4. Food consists of food and beverages purchased for off-premises consumption; food services, which include purchased meals and beverages, are not classified as food.

5. Consists of gasoline and other energy goods and of electricity and gas services.

6. Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

Legend / Footnotes:

1. Net expenses of NPISHs, defined as their gross operating expenses less primary sales to households.

2. Gross output is net of unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; excludes own-account investment (construction and software).

3. Excludes unrelated sales, secondary sales, and sales to business, to government, and to the rest of the world; includes membership dues and fees.

4. Food consists of food and beverages purchased for off-premises consumption; food services, which include purchased meals and beverages, are not classified as food.

5. Consists of gasoline and other energy goods and of electricity and gas services.

6. Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

6. Market-based PCE is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most imputed transactions (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

Note. Chained (2009) dollar series are calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Legend / Footnotes:

1. Consists primarily of contributions by residents of the U.S. territories and the Commonwealths of Puerto Rico and Northern Mariana Islands.

2. Prior to 1960, interest payments to persons (line 28) and interest receipts on line 12 are not shown separately, but are included in interest payments (line 27), which is shown net of interest receipts. Interest payments to persons and business includes interest accrued on the actuarial liabilities of defined benefit pension plans for government employees.

3. Prior to 1999, current transfer payments to the rest of the world (line 26) are displayed net of current transfer receipts from the rest of the world (line 18).

4. Prior to 1959, subsidies (line 30) and the current surplus of government enterprises (line 19) are not shown separately; subsidies are presented net of the current surplus of government enterprises.

5. Prior to 1960, government social benefits to the rest of the world are included in line 26, 'Other current transfer payments to the rest of the world.'

Legend / Footnotes:

1. Includes dividends tax for 1933-34 and automobile use tax for 1942-46 as shown in table 3.4.

2. Includes the capital stock tax for 1933-45 as shown in table 3.5.

3. Consists primarily of contributions by residents of the U.S. territories and the Commonwealths of Puerto Rico and Northern Mariana Islands.

4. Prior to 1960, interest payments to persons and business (line 33) and interest receipts (line 15) are not shown separately, but are included in interest payments (line 32), which is shown net of interest receipts. Interest payments to persons and business includes interest accrued on the actuarial liabilities of defined benefit pension plans for federal government employees.

5. Rents and royalties are receipts from the leasing of federally owned lands and mineral deposits. These values do not include bonus payments made to secure such leases.

6. Prior to 1999, current transfer payments to the rest of the world are displayed net of current transfer receipts from the rest of the world.

7. Prior to 1959, subsidies (line 35) and the current surplus of government enterprises (line 22) are not shown separately; subsidies are presented net of the current surplus of government enterprises.

8. Prior to 1960, government social benefits to the rest of the world (line 28) are included in line 31, 'Other current transfer payments to the rest of the world.'

Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).

2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).

2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).

2. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Note. Chained (2009) dollar series are calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development in table 3.9.5.

5. Includes federal purchases of research and development produced by state and local general government.

Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).
2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.
3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.
4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development in table 3.9.5.
5. Includes federal purchases of research and development produced by state and local general government.

Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development in table 3.9.5.

5. Includes federal purchases of research and development produced by state and local general government.

Legend / Footnotes:

1. Government consumption expenditures are services (such as education and national defense) produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development in table 3.9.5.

5. Includes federal purchases of research and development produced by state and local general government.

Note. Chained (2009) dollar series are calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Legend / Footnotes:

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Legend / Footnotes:

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).
2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.
3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.
4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development.
5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Legend / Footnotes:

1. National defense consumption expenditures are defense services produced by government that are valued at their cost of production. Excludes government sales to other sectors and government own-account investment (construction, software, and research and development).

2. Consumption of fixed capital, or depreciation, is included in government gross output as a partial measure of the services of general government fixed assets; the use of depreciation assumes a zero net return on these assets.

3. Includes general government intermediate inputs for goods and services sold to other sectors and for own-account investment.

4. Own-account investment is measured in current dollars by compensation of general government employees and related expenditures for goods and services and is classified as investment in structures, software, and research and development.

5. Gross government investment consists of general government and government enterprise expenditures for fixed assets; inventory investment is included in government consumption expenditures.

Note. Chained (2009) dollar series are calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Legend / Footnotes:

1. Exports and imports of certain goods, primarily military equipment purchased and sold by the federal government, are included in services. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to services.

2. Prior to 1999, current taxes, contributions for government social insurance, and transfer receipts from the rest of the world (line 13) are not separately displayed, and line 29 includes current taxes and transfer payments to the rest of the world net of current taxes, contributions for government social insurance, and transfer receipts from the rest of the world.

3. Consists of capital transfers and the acquisition and disposal of nonproduced nonfinancial assets. Prior to 1982, reflects only capital grants paid to the U.S. territories and the Commonwealths of Puerto Rico and Northern Mariana Islands.

Legend / Footnotes:

n.e.c. Not elsewhere classified

1. Exports and imports of certain goods, primarily military equipment purchased and sold by the federal government, are included in services. Beginning with 1986, repairs and alterations of equipment are reclassified from goods to services.

2. The quantity index for computers can be used to accurately measure the real growth of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 4.2.2 and real growth rates are shown in table 4.2.1.

3. Includes net exports of goods under merchanting, beginning in 1999, reclassified from services to goods.

4. Includes maintenance and repair services, insurance services, financial services, telecommunication, computer and information services and other other business services.

5. Includes parts of foods, feeds, and beverages, of nondurable industrial supplies and materials, and of nondurable nonautomotive consumer goods.

Note. Chained (2009) dollar series are calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. For exports and for imports, the residual line is the difference between the aggregate line and the sum of the most detailed lines.

Legend / Footnotes:

1. Includes petroleum and mineral exploration.

2. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.

3. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.

4. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.

5. Excludes software embedded, or bundled, in computers and other equipment.

6. Research and development investment excludes expenditures for software development. Software development expenditures are included in software investment on line 17.

7. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures and adjoining land, and other ownership transfer costs.

8. Excludes net purchases of used structures and brokers' commissions on the sale of structures.

9. Excludes net purchases of used structures and brokers' commissions and other ownership transfer costs.

Legend / Footnotes:

1. Includes petroleum and mineral exploration.

2. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.

3. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.

4. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.

5. Excludes software embedded, or bundled, in computers and other equipment.

6. Research and development investment excludes expenditures for software development. Software development expenditures are included in software investment on line 17.

7. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures and adjoining land, and other ownership transfer costs.

8. Excludes net purchases of used structures and brokers' commissions on the sale of structures.

9. Excludes net purchases of used structures and brokers' commissions and other ownership transfer costs.

Legend / Footnotes:

1. Includes petroleum and mineral exploration.
2. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.
3. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.
4. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.
5. Excludes software embedded, or bundled, in computers and other equipment.
6. Research and development investment excludes expenditures for software development. Software development expenditures are included in software investment on line 17.
7. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures and adjoining land, and other ownership transfer costs.
8. Excludes net purchases of used structures and brokers' commissions on the sale of structures.
9. Excludes net purchases of used structures and brokers' commissions and other ownership transfer costs.

32	Private fixed investment in information processing equipment and software	641.6	676.5	665.2	666.4	685.8	688.8	685.4

Legend / Footnotes:

1. Includes petroleum and mineral exploration.

2. Consists primarily of religious, educational, vocational, lodging, railroads, farm, and amusement and recreational structures, net purchases of used structures, and brokers' commissions on the sale of structures.

3. The quantity index for computers can be used to accurately measure the real growth rate of this component. However, because computers exhibit rapid changes in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series; accurate estimates of these contributions are shown in table 5.3.2 and real growth rates are shown in table 5.3.1.

4. Includes communication equipment, nonmedical instruments, medical equipment and instruments, photocopy and related equipment, and office and accounting equipment.

5. Consists primarily of furniture and fixtures, agricultural machinery, construction machinery, mining and oilfield machinery, service industry machinery, and electrical equipment not elsewhere classified.

6. Excludes software embedded, or bundled, in computers and other equipment.

7. Research and development investment excludes expenditures for software development. Software development expenditures are included in software investment on line 17.

Table 5.3.6. Real Private Fixed Investment by Type, Chained Dollars

[Billions of chained (2009) dollars] Seasonally adjusted at annual rates

Last Revised on: April 28, 2016 - Next Release Date May 27, 2016

8. Consists primarily of manufactured homes, improvements, dormitories, net purchases of used structures, and brokers' commissions on the sale of residential structures.

9. Excludes net purchases of used structures and brokers' commissions on the sale of structures.

10. Excludes net purchases of used structures and brokers' commissions and other ownership transfer costs.

Note. Chained (2009) dollar series are calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Legend / Footnotes:

1. This series is derived from the Census Bureau series 'current cost inventories.'

2. The inventory valuation adjustment (IVA) shown in this table differs from the IVA that adjusts business incomes. The IVA in this table reflects the mix of methods (such as first-in, first-out and last-in, first-out) underlying inventories derived primarily from Census Bureau statistics (see footnote 1). This mix differs from that underlying business income derived primarily from Internal Revenue Service statistics.

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

Legend / Footnotes:

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

Chained (2009) dollar series for real change in private inventories are calculated as the period-to-period change in chained-dollar end-of-period inventories. Quarterly changes in end-of-period inventories are stated at annual rates. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

29	Nonfarm inventories to final sales of goods and structures	4.17	4.13	4.07	4.06	4.09

Legend / Footnotes:

1. Inventories are as of the end of the quarter. The quarter-to-quarter change in inventories calculated from current-dollar inventories in this table is not the current-dollar change in private inventories component of GDP. The former is the difference between two inventory stocks, each valued at its respective end-of-quarter prices. The latter is the change in the physical volume of inventories valued at average prices of the quarter. In addition, changes calculated from this table are at quarterly rates, whereas, the change in private inventories is stated at annual rates.

2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and imputed rental of owner-occupied nonfarm housing. It includes a small amount of final sales by farm and by government enterprises.

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

24	Nondurable goods industries	208.7	214.1	218.9	220.9	224.3
25	Nonmerchant wholesale trade	88.9	89.5	89.6	92.0	91.1
26	Final sales of domestic business ²	930.9	943.1	950.9	955.3	957.5
27	Final sales of goods and structures of domestic business ²	520.1	529.3	534.8	535.0	534.3
	Ratios of private inventories to final sales of domestic business:					
28	Private inventories to final sales	2.35	2.35	2.36	2.37	2.38
29	Nonfarm inventories to final sales	2.18	2.18	2.18	2.19	2.20
30	Nonfarm inventories to final sales of goods and structures	3.90	3.88	3.88	3.91	3.95

Legend / Footnotes:

1. Inventories are as of the end of the quarter. The quarter-to-quarter changes calculated from this table are at quarterly rates, whereas the change in private inventories component of GDP is stated at annual rates.

2. Quarterly totals at monthly rates. Final sales of domestic business equals final sales of domestic product less gross output of general government, gross value added of nonprofit institutions, compensation paid to domestic workers, and imputed rental of owner-occupied nonfarm housing. It includes a small amount of final sales by farm and by government enterprises.

Note. Estimates in this table are based on the North American Industry Classification System (NAICS).

Chained (2009) dollar inventory series are calculated to ensure that the chained (2009) dollar change in inventories for 2009 equals the current-dollar change in inventories for 2009 and that the average of the 2008 and 2009 end-of-year chain-weighted and fixed-weighted inventories are equal.

Legend / Footnotes:

1. Consists of used light trucks only.

2. Consists of final sales and change in private inventories of new autos assembled in the United States.

3. Consists of sales of imported new autos in personal consumption expenditures, in private fixed investment, and in gross government investment.

Note. Chained (2009) dollar series are calculated as the product of the chain-type quantity index and the 2009 current-dollar value of the corresponding series, divided by 100. Because the formula for the chain-type quantity indexes uses weights of more than one period, the corresponding chained-dollar estimates are usually not additive. The residual line is the difference between the first line and the sum of the most detailed lines.

Preview of the 2016 Annual Revision of the International Economic Accounts

By Alexis N. Grimm, Kristy L. Howell, and Daniel R. Yorgason

IN JUNE, the Bureau of Economic Analysis (BEA) will release the results of the 2016 annual revisions of the U.S. international transactions accounts (ITAs) and the U.S. international investment position (IIP) accounts. As part of annual revisions, statistics are revised to incorporate newly available and revised source data, changes in definitions and classifications, and changes in estimation methods. In addition, seasonally adjusted statistics are revised to reflect recalculated seasonal and trading day adjustments.

As with previous annual revisions, this year's annual revisions will incorporate newly available and revised source data for the preceding 3 years and for additional years for selected series.¹ In addition, BEA will incorporate newly available source data from benchmark surveys of foreign direct investment in the United States and of financial services transactions between U.S. financial services providers and foreign persons. BEA will also implement a refined method for estimating exports and imports of travel services.

This article provides an overview of these changes. As a result of the revisions, the international economic account statistics will reflect more accurate source information and will be in further alignment with international statistical guidelines.

Incorporation of results from benchmark surveys

BEA collects information on direct investment and international trade in services through mandatory surveys of U.S. companies. In addition to quarterly and annual surveys, which collect information from a sample of companies whose transactions or positions are covered in the relevant ITA or IIP accounts, BEA also conducts benchmark surveys every 5 years to collect information from the universe of such companies.

1. For information on BEA's revision policy and on data sources and estimation methodologies, see *U.S. International Economic Accounts: Concepts and Methods* on BEA's Web site.

Investment positions, transactions in financial assets and liabilities, and related income receipts and payments for 2012–2015 will be revised to incorporate the results of BEA's 2012 Benchmark Survey of Foreign Direct Investment in the United States. This benchmark survey covers all U.S. resident entities that are foreign-owned.

Financial services exports and imports for 2013–2015 will be revised to incorporate the results of BEA's 2014 Benchmark Survey of Financial Services Transactions Between U.S. Financial Services Providers and Foreign Persons. This benchmark survey covers all U.S. financial services providers that have sales to, or purchases from, foreign persons. The number of responses to this benchmark survey increased substantially from the previous benchmark survey conducted in 2009. The 2014 survey captured the transactions of a significant number of new reporters—primarily investment managers and hedge funds—that were not previously in BEA's universe.

Improved methodology and source data for travel services

The travel accounts of the ITAs record expenditures on goods and services by foreign residents visiting the United States (U.S. exports) and by U.S. residents visiting other countries (U.S. imports). They include both business and personal travel (see table A). In 2015, travel-related expenditures accounted for 25 percent of total trade in services (U.S. exports plus U.S. imports).

Combined, other business travel and other personal travel compose a subaggregate measure of "travel (for all purposes including education)" that excludes both expenditures by travelers whose primary purpose for travel is education or health and expenditures by border, seasonal, and other short-term workers. In 2015, other business travel and other personal travel together accounted for nearly 75 percent of U.S. travel exports and for more than 90 percent of U.S. travel imports.

For all countries other than Canada and Mexico and excluding cruise-related travel expenditures, this sub-aggregate component of the travel account is derived by multiplying the number of travelers by a measure of their average expenditures.² The number of travelers is obtained from the National Travel and Tourism Office (NTTO) of the International Trade Administration in the U.S. Department of Commerce and is based on data collected by the U.S. Customs and Border Protection (CBP) of the U.S. Department of Homeland Security. Average expenditures are based on data obtained from the Survey of International Air Travelers (SIAT), conducted by NTTO. The number of travelers and SIAT expenditure data include the country of residence for foreign travelers to the United States and countries of destination for U.S. travelers abroad. The subaggregate component of the travel account is allocated to other business travel and other personal travel using information from the SIAT.

Beginning with statistics for 2013, BEA will refine its methodology for estimating average expenditures for other business and other personal travel exports and imports for countries other than Canada and Mexico. BEA currently estimates average expenditures by individual country or by country group from expenditures reported on the SIAT. For countries with smaller sample sizes, expenditures are averaged over

time or across similar countries. BEA will introduce an improved method based on a moving average of the quarterly estimates used currently for estimating average expenditures. This approach will be less influenced by data variability introduced by small sample sizes and by survey sample outliers.

BEA will also incorporate revised source data for other business and other personal travel exports. Source data on the number of foreign travelers to the United States collected by CBP were revised to incorporate two improvements related to CBP's implementation of the automated collection of travel documents from foreign visitors entering the United States in 2013.³

Beginning with statistics for 2013, the number of foreign travelers will be revised to cover travelers whose country of residence was not collected under CBP's automated collection of travel documents. BEA currently does not include travelers with missing countries of residence in its estimates of other business and other personal travel exports because the number of travelers for whom the country of residence was missing was not significant until 2015. For 2014 and 2015, the source data BEA receives from NTTO were revised to replace a traveler's missing country of residence with the traveler's country of citizenship. For 2013, BEA estimated the country of residence for those travelers missing a country of residence based on country shares used for 2014.

2. Statistics for Canada and Mexico are based on data provided to BEA by Statistics Canada and the Bank of Mexico. Statistics for travel by cruise are based on data from the Department of Homeland Security and several private sources.

3. More information on both of these revisions to source data is available from the [National Travel and Tourism Office](#).

Table A. U.S. Trade in Travel Services

[Millions of dollars]

	Exports			Imports		
	2013	2014	2015	2013	2014	2015
Total U.S. trade in services	687,894	710,565	710,165	463,700	477,428	490,613
<i>Of which:</i>						
Travel (for all purposes including education)	172,901	177,241	178,297	104,107	110,787	120,471
Business.....	39,411	40,358	36,940	21,116	18,264	17,326
Expenditures by border, seasonal, and other short-term workers.....	7,164	7,255	7,490	1,209	1,261	1,275
Other business travel.....	32,247	33,103	29,450	19,907	17,003	16,051
Personal.....	133,490	136,883	141,356	82,990	92,523	103,145
Health related.....	3,312	3,468	3,597	1,443	1,624	1,828
Education related.....	27,410	30,795	34,526	6,489	6,824	7,215
Other personal travel.....	102,768	102,620	103,233	75,058	84,075	94,102

NOTE. The data are from table 3.1 of the international transactions accounts

Beginning with statistics for 2014, BEA will incorporate data into the travel estimates on the number of foreign travelers entering the United States who stay for only one night. Although international statistical standards, including the International Monetary Fund's *Balance of Payments and International Investment Position Manual, Sixth Edition* (BPM6), call for U.S. travel exports to include expenditures by all visitors who maintain a substantial economic interest in an economy other than the United States regardless of length of stay, past source data limitations led to the exclusion of travelers who stay for only one night. CBP's implementation of the automated collection of travel documents has led to a more accurate accounting of visitors who stay for only one night, and, as a result, BEA is now able to include these travelers in the source data that BEA uses to estimate other business and other personal travel exports.

Improved source data for air passenger transport exports

Air passenger transport exports measure payments by nonresidents to U.S. air carriers for transportation to and from the United States and between two foreign countries. BEA compiles air passenger transport statistics for countries and areas other than Canada by multiplying data on the number of travelers by estimates of average air fares.⁴ The number of travelers is from NTTO, based on data collected by CBP. Average fares are based on information from the SIAT. BEA will revise its estimates of air passenger transport exports by incorporating the revised CBP data on the number of travelers that were described above.

4. For travel to and from Canada, BEA uses data provided by Statistics Canada.

Trends in U.S. Trade in Information and Communications Technology (ICT) Services and in ICT-Enabled Services

By Alexis N. Grimm

INFORMATION AND COMMUNICATIONS technologies (ICT) play a vital role in the facilitation of trade in many types of services. Technological advances and reductions in costs for ICT over time have led to a greater opportunity for the remote provision and procurement of services across international borders. The desire to understand how these technological changes may affect international trade in ICT services and of the services trade taking place over ICT networks has led to increased interest in measuring such trade. This article builds on the international statistical community's recent progress toward more precisely defining the types of services that fall into these categories. It presents statistics for 1999–2014 of U.S. trade in ICT and potentially ICT-enabled services using statistics published by the Bureau of Economic Analysis (BEA) on international trade in services. In keeping with the Bureau of Economic Analysis's mission, these statistics promote a better understanding how U.S. companies engaged in services trade are reaching global markets. They also shed light on whether and how companies have reconfigured their global value chains over time in response to improvements in ICT.

This article updates and extends an earlier paper, "Trends in Digitally Enabled Trade in Services, 1998–2010," which featured estimates of ICT-enabled services trade (referred in that article as "digitally enabled" services trade) compiled from statistics published by BEA.¹ This article refines the definition of ICT-enabled services used in the earlier article with the expanded detail in trade in services resulting from the comprehensive restructuring of the international economic accounts in 2014.² It also introduces statistics on trade in ICT services and country-level statistics on trade in potentially ICT-enabled services.

ICT services are those services that are used to facilitate information processing and communication. ICT services presented in this article include three categories of services from BEA's published statistics on international trade in services: telecommunications services, computer services, and charges for the use of intellectual property associated with computer software (table A). ICT-enabled services are "services with

outputs delivered remotely over ICT networks."³ This

ICT Information and communications technology

ICT services

Other potentially ICT-enabled services

(D) Suppressed to avoid the disclosure of the data of individual companies.

n.i.e. Not included elsewhere

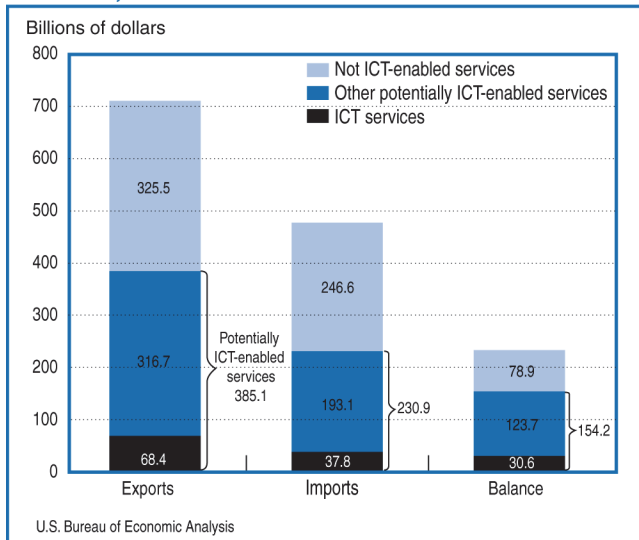

1. Maria Borga and Jennifer Koncz-Bruner. "Trends in Digitally Enabled Trade in Services, 1998–2010" (June 2012).

2. For more information, see Maria Borga and Kristy L. Howell, "The Comprehensive Restructuring of the International Economic Accounts: Changes in Definitions, Classifications, and Presentations," SURVEY OF CURRENT BUSINESS 90 (March 2014).

article also features a more broadly defined concept, *potentially* ICT-enabled services. For many types of services, the actual mode of delivery is unknown. Potentially ICT-enabled services include services types that *can* predominantly be delivered remotely over ICT networks without identifying the services that *are* delivered over ICT networks. See the box, “Defining ICT and Potentially ICT-Enabled Trade in Services.” Statistics on potentially ICT-enabled services are composed of BEA’s published statistics on international trade in insurance services; financial services; charges for the use of intellectual property n.i.e.; telecommunications, computer, and information services; and certain other services included in other business services (table A). Potentially ICT-enabled services include ICT services. Before 2006, limited detail is available for statistics on certain types of services trade. Consequently, ICT and potentially ICT-enabled statistics for 1999–2005 are partly based on estimates of subcomponents within services categories.⁴

In 2014, exports of ICT services were \$68.4 billion, and imports of ICT services were \$37.8 billion, resulting in a trade surplus in ICT services of \$30.6 billion. Exports of potentially ICT-enabled services were \$385.1 billion, and imports of potentially ICT-enabled services were \$230.9 billion, resulting in a trade surplus of \$154.2 billion (chart 1). The statistics on trade

Chart 1. Trade in ICT and Potentially ICT-Enabled Services, 2014

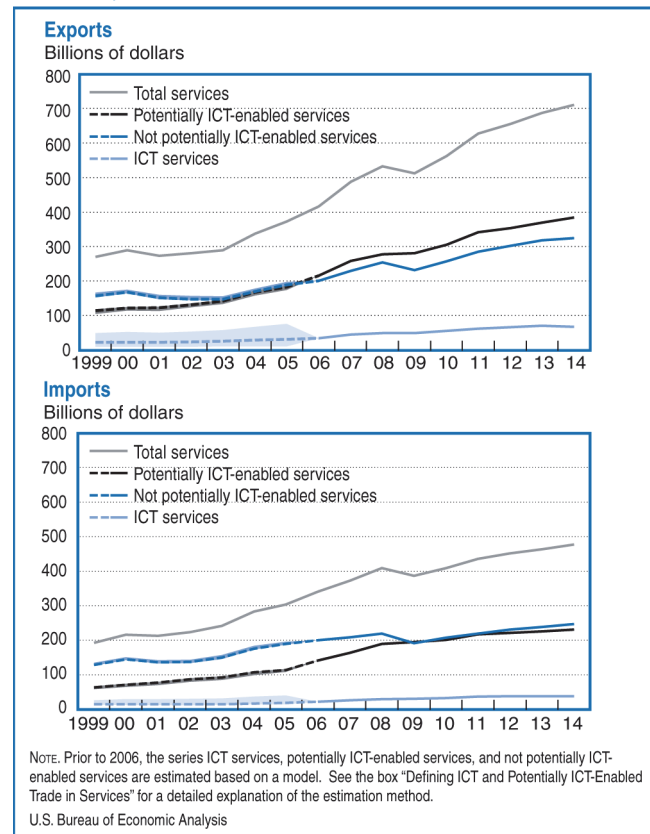

in ICT services and trade in potentially ICT-enabled services presented in this article are available starting

4. For more detailed definitions of ICT and potentially ICT-enabled services, see the box “Defining ICT and Potentially ICT-Enabled Trade in Services.” For the full list of types of trade in services in BEA’s published statistics that are identified as ICT and as potentially ICT-enabled, see table 1.

for 1999, the earliest year for which BEA has published data on trade in services by type that allow for ICT services and potentially ICT-enabled services to be separately identified or estimated.⁵ From 1999 to 2014, ICT services exports and potentially ICT-enabled services exports and imports more than tripled, and ICT services imports more than doubled (chart 2).⁶ Exports of

Chart 2. Trade in ICT and Potentially ICT-Enabled Services, 1999–2014

both ICT and potentially ICT-enabled services grew faster than imports, leading to an increase in the trade surplus in ICT services from 1.7 percent to 2.6 percent of total trade in services (exports plus imports) and to an increase in the trade surplus in potentially ICT-enabled services from 10.9 percent to 13.0 percent of total trade in services. The growth in the surplus on trade in potentially ICT-enabled services contributed to the growth of the surplus on trade in all services, which

5. The statistics presented in this article are calculated from BEA’s published statistics on trade in services, not from the underlying data used to compile the services trade statistics. For future years, statistics on trade in ICT services and trade in potentially ICT-enabled services will be calculated from the underlying data by the same processing system used for the other services trade statistics. The statistics in this article may differ slightly from those that will be published in future years because of differences in the rounding procedures used.

6. All statistics presented in this article are in current dollars and all growth rates are in nominal terms.

increased from 16.9 percent to 19.6 percent of total trade in services over the same period.

This article describes trade in ICT services and in potentially ICT-enabled services in 2014 and examines trends in these series from 1999. First, overall trade is discussed, followed by a discussion of U.S. trade in ICT and potentially ICT-enabled services by partner country. Summary statistics are provided in each section. For additional statistics, see tables 1–8 that follow this article. The following are key findings identified in this article:

- From the early 2000s to 2008, trade in ICT and potentially ICT-enabled services grew most rapidly. Growth slowed considerably in 2009, reflecting the broader economic slowdown and then resumed in 2010 for exports and in 2011 for imports before starting to slow again in 2012. Exports and imports of ICT services contracted in 2014.
- In 2014, the majority of trade in ICT services was between affiliated trading partners, and the majority of trade in potentially ICT-enabled services was between unaffiliated trading partners.
- In 2014, Europe accounted for the most exports of ICT services, exports of potentially ICT-enabled services, and imports of potentially ICT-enabled services by region. Asia and Pacific accounted for the most imports of ICT services.
- In 2014, the United States had trade surpluses in ICT services with every region except the Middle East and with all regions in potentially ICT-enabled services. The largest trade surpluses in ICT services were with Europe and Latin America and Other Western Hemisphere. The largest surpluses in potentially ICT-enabled services were with Europe and Asia and Pacific.

U.S. Exports

ICT services

In 2014, the most recent year for which BEA's most detailed annual trade in services statistics are available, exports of ICT services were \$68.4 billion, or 9.6 percent of total services exports (table B). By service type, more than half of ICT exports in 2014 were exports that reflect charges for the use of intellectual property associated with computer software (chart 3). By affiliation status of trading partners, just over half of all ICT exports were to affiliated purchasers in 2014 (table C).

From 1999, the earliest year for which BEA has published data on trade in services by type that allow for ICT services to be separately identified or estimated, to 2014, ICT exports increased at an average annual rate of 7.6 percent (table D). Over that same period, exports of all services types grew by an average annual rate of 6.6 percent, resulting in an increase in ICT ser-

vices' share of all services exports to 9.6 percent from 8.3 percent (table B). Exports of ICT services grew rapidly from 2003 to 2008, but growth slowed in 2009, reflecting the broader economic slowdown. Growth resumed in 2010 and 2011, but slowed again from 2012

to 2013. ICT exports contracted in 2014. More than half of the increase in ICT exports from 1999–2014 was in exports that reflect charges for the use of intellectual property associated with computer software, which more than tripled over that period (chart 3).

Potentially ICT-enabled services

Exports of potentially ICT-enabled services were \$385.1 billion in 2014, accounting for 54.2 percent of total services exports (table B). The services categories

Chart 3. Trade in ICT Services by Service Type, 1999–2014

with the largest potentially ICT-enabled exports in 2014 were exports that reflect charges for the use of intellectual property n.i.e. and the potentially ICT-enabled services types categorized under other business services (chart 4). In 2014, 50.5 percent of potentially ICT-enabled exports were to affiliated trading partners (table C).⁷

From 1999 to 2014, potentially ICT-enabled exports grew at an average annual rate of 8.4 percent (table D). Exports of not potentially ICT-enabled services, which mainly consist of travel (for all purposes including education), transport, maintenance and repair services n.i.e., and government goods and services n.i.e., grew at an average annual rate of 5.0 percent over the same period, resulting in an increase in potentially ICT-enabled services' share of all services exports to 54.2 percent from 42.3 percent. Most of this growth was in the first half of the period; growth slowed in 2009 but resumed in 2010 and 2011, before slowing again from 2012 to 2014.

Among the major categories of services, the largest increases in potentially ICT-enabled services exports for 1999–2014 were in charges for the use of intellectual property n.i.e., the potentially ICT-enabled portion of other business services, and in financial services (chart 4). The major categories with the fastest average annual rates of growth over the same period were insurance services (12.3 percent) and financial services (10.5 percent) (table 1).

7. In addition to the services types included in potentially ICT-enabled services for the trade by all affiliation types, the statistics by affiliation also include trade-related services, sports and performing arts, and mining, which cannot be disaggregated from the potentially ICT-enabled services in the category "other" technical, trade-related, and other business services (lines 58 and 117 of international services table 2.3). In 2014, the total of these three categories for all countries accounted for 53.8 percent of the category "other" technical, trade-related, and other business services exports and 1.5 percent of potentially ICT-enabled services exports; for imports, these shares were 37.4 percent and 1.8 percent, respectively.

Data Availability

Tables A–E and 1–8 presented in this article are available in an Excel file on [BEA's Web site](#). Statistics on ICT services and potentially ICT-enabled services for 2015 will be released in October 2016 when BEA publishes its most detailed annual statistics for U.S. international services. The statistics presented in this article for 2013 and 2014 will also be revised at that time.

U.S. Imports

ICT services

Imports of ICT services were \$37.8 billion, accounting for 7.9 percent of total services imports in 2014 (table B). Nearly two-thirds of ICT imports were in computer services (chart 3). Seventy percent of all ICT imports were from affiliated trading partners (table C).

From 1999 to 2014, ICT imports grew at an average annual rate of 6.5 percent, while imports of all services types grew at an average annual rate of 6.2 percent, leading to a slight increase in the share of ICT services imports of all services imports to 7.9 percent from 7.6 percent (tables D and B). ICT imports more than doubled from 2002 to 2008, but their growth slowed in 2009. As with growth in ICT exports, after increasing from 2010 to 2011, growth in ICT imports again slowed from 2012 to 2013 and ICT imports contracted in 2014. More than 80 percent of the increase in ICT imports over the period 1999–2014 was due to an increase in imports of computer services, and the remainder was more than accounted for by an increase in imports that reflected charges for the use of computer software. Imports of telecommunications services contracted between 1999 and 2014 (chart 3).

Potentially ICT-enabled services

In 2014, imports of potentially ICT-enabled services were \$230.9 billion, accounting for 48.4 percent of to-

tal services imports (table B). The potentially ICT-enabled services in other business services and insurance services combined for more than half of total potentially ICT-enabled services imports (chart 4). In 2014, 52.9 percent of potentially ICT-enabled imports were from unaffiliated trading partners (table C).

From 1999 to 2014, potentially ICT-enabled imports grew at an average annual rate of 8.9 percent, while imports of not potentially ICT-enabled services grew at an average annual rate of 4.4 percent, resulting in an increase in potentially ICT-enabled services' share of all services imports to 48.4 percent from 33.3 percent (tables D and B). Growth was most rapid in 2004–2008, then slowed in 2009–2010, reflecting the broader economic slowdown. Growth resumed in 2011, but again slowed from 2012 to 2014.

Other business services and insurance services together accounted for nearly two-thirds of the increase in potentially ICT-enabled services imports in 1999–2014 (chart 4). They also were the categories with the most rapid growth over the same period; insurance grew at an average annual rate of 11.8 percent, and the potentially ICT-enabled services in other business services—research and development services, professional and management consulting services, architectural and engineering services, industrial engineering, training services, and other business services n.i.e.—collectively grew at an average annual rate of 10.4 percent (table 2).

n.a. not available

..... Not applicable

ICT Information and communications technology

n.i.e. Not included elsewhere

1. Insurance services transactions are considered to be unaffiliated even when they are between affiliated companies because the services are considered to be provided to the policyholders who pay the insurance premiums and who are unaffiliated with either company. The only insurance services considered to be affiliated are primary insurance transactions between

a U.S. company that is not an insurance company and an affiliated foreign insurance company, such as a captive foreign insurance affiliate. Data on these affiliated insurance services are not separately available.

2. Transactions in basic telecommunications services are considered to be unaffiliated, even when the services flow through affiliated channels, because they represent the distribution of revenues collected from unaffiliated customers. Other types of telecommunications services, such as value-added services, may flow through either affiliated or unaffiliated channels, and are recorded accordingly.

ICT Information and communications technology

1. The growth rates for the balances for 2003 and 2006 are not shown, because the balance transitioned to a surplus from a deficit or to a deficit from a surplus.

U.S. Trade Balance

ICT services

The surplus on ICT services was \$30.6 billion in 2014, primarily reflecting a surplus on charges for the use of intellectual property associated with computer software (table B). From 1999 to 2014, the surplus on ICT services grew at an average annual rate of 9.4 percent, while the surplus on all services types grew at an average annual rate of 7.5 percent, leading to an increase in the ICT services' share of the all-services surplus to 13.1 percent from 10.1 percent (tables D and B). Nearly all of the increase in the surplus on ICT services in 1999–2014 was due to an increase in the surplus on

Chart 4. Trade in Potentially ICT-Enabled Services by Service Type, 1999–2014

1. The category other business services reflects only the services types categorized under other business services that are considered potentially ICT-enabled. The point estimates of exports and imports in these services types for 1999–2005 are model based. See the box "Defining ICT and Potentially ICT-Enabled Trade in Services" for a detailed explanation of the estimation method.

U.S. Bureau of Economic Analysis

charges for the use of intellectual property associated with computer software. Over the same period, the balance of trade in telecommunications services shifted from a deficit to a surplus, and the deficit on computer services grew.

Potentially ICT-enabled services

In 2014, the surplus on potentially ICT-enabled services was \$154.2 billion, primarily reflecting surpluses on charges for the use of intellectual property n.i.e., financial services, and the potentially ICT-enabled components in other business services (table B). A deficit on insurance services was partly offsetting. From 1999 to 2014, the surplus on potentially ICT-enabled services grew at an average annual rate of 7.7 percent, while the surplus on imports of not potentially ICT-enabled services grew at an average annual rate of 7.2 percent, resulting in a slight increase in the potentially ICT-enabled services' share of the surplus on total services to 66.2 percent from 64.6 percent (tables D and B). An increase in the surpluses on financial services and on charges for the use of intellectual property n.i.e. more than accounted for the increase in the surplus on potentially ICT-enabled services.

ICT and ICT-Enabled Services by Partner Country

The share of total services trade in ICT and potentially ICT-enabled services exports and imports varies by region and by country. BEA's statistics on potentially ICT-enabled services by country use a slightly different definition of potentially ICT-enabled services than for

the all-country totals in the previous section because less detail is available by service type in BEA's published statistics of trade in services by country.⁸ For countries for which one or more of the components of ICT or potentially ICT-enabled services exports or imports was suppressed to avoid the disclosure of data of individual companies, a range of possible values was calculated to rank the value of ICT and potentially ICT services exports and imports for all countries whose U.S. exports and imports of services are separately published by BEA.⁹

8. In addition to those services types included in potentially ICT-enabled services for the trade with all countries statistics, the statistics by partner country also include trade-related services, sports and performing arts, and mining, which cannot be disaggregated from the potentially ICT-enabled services in the category "other" technical, trade-related, and other business services (lines 58 and 117 of international services table 2.3). In 2014, the total of these three categories for all countries accounted for 53.8 percent of the category "other" technical, trade-related, and other business services exports and 1.5 percent of potentially ICT-enabled services exports. For imports these shares were 37.4 percent and 1.8 percent, respectively.

9. ICT and potentially ICT-enabled statistics have more suppressions than some other BEA datasets because the suppression procedures applied to the components did not account for the eventuality that the ICT and potentially ICT-enabled totals would be published. In most cases the categories that are suppressed are relatively small parts of the total. For countries where one or more components are suppressed, charts 6, 9, 12, and 14–16 include an upper bound and lower bound that establish a range of possible values. The lower bound is equal to the sum of the unsuppressed services types included in ICT or potentially ICT-enabled services that appear in charts 6, 9, 12, and 14–16. The upper bound is calculated as the sum of the parent category of the suppressed component less any unsuppressed sub-categories of that parent that are not considered ICT or potentially ICT-enabled services trade in charts 6, 9, 12, and 14–16. The lower bound is used to rank each country's total ICT services and potentially ICT-enabled services trade in charts 6–14. More sophisticated methods for determining the lower and upper bounds exist and may have served to tighten the range of the bounds, but these were not used to compile these charts.

Worldwide Trends in ICT-Enabled Trade in Services

Many countries do not compile statistics at the level of detail needed to calculate ICT services or potentially ICT-enabled services trade statistics. In addition, in recent years, many countries have restructured their trade in services statistics to conform more closely with the "Extended Balance of Payments Services Classification" presented in the updated *Manual on Statistics of International Trade in Services 2010*, thus limiting the comparability of statistics for recent years with those for older years. Despite these limitations, data on trade in services collected by the Organisation for Economic Co-operation and Development (OECD) from its member countries were used to calculate comparable estimates of ICT and potentially ICT-enabled trade for 2010–2014 for a set of countries that accounted for 67 percent of world exports and 58 percent of world imports in 2014.¹ For these countries, 50 percent of exports and 46 percent of imports were potentially ICT-enabled in 2014, an increase in both shares from 47 percent of exports and 43

percent of imports in 2010. These figures suggest that the share of global trade in services accounted for by potentially ICT-enabled trade has increased over this period. The shares for other countries are lower than the shares for the United States, which remained at 54 percent for exports in 2014 and 2010, and decreased slightly to 48 percent in 2014 from 49 percent in 2010 for imports.

1. The countries included in this comparison are Australia, Canada, the European Union (28 member countries), Hong Kong, Israel, the Republic of Korea, New Zealand, Russia, and the United States. The shares of world exports and imports for this set of countries were calculated using the World Trade Organization's 2015 international trade in services statistics. Potentially ICT-enabled services exports and imports were calculated for these countries using statistics available in the OECD.stat database on trade in services by partner country as the sum of the following services type categories: insurance and pension services; financial services; charges for the use of intellectual property n.i.e.; telecommunications, computer, and information services; research and development services; professional and management consulting services; architectural, engineering, scientific and other technical services; and other business services n.i.e.

U.S. exports

ICT services

By major region, the 2014 rank ordering of ICT services exports was the same as the rank ordering of total exports. Europe accounted for the most exports of ICT and total services, followed by Asia and Pacific and Latin America and Other Western Hemisphere (table E and chart 5). Nonetheless, ICT services shares of total exports varied by region. The largest ICT shares were for Latin America and Other Western Hemisphere (11.9 percent) and Europe (10.4 percent); the Middle East had the lowest share (3.5 percent) (table E). By country, the top five destinations for ICT exports in 2014 of those separately published by BEA were Brazil, the United Kingdom, Canada, Japan, and Germany

(D) Suppressed to avoid the disclosure of data of individual companies.

ICT Information and communications technology

NOTE: The regions do not sum to the totals for all countries for potentially ICT-enabled

services, other potentially ICT-enabled services, and not potentially ICT-enabled services because a slightly different definition of potentially ICT-enabled services was used to produce the statistics by partner country.

(chart 6).¹⁰ These top five countries are among the top nine markets for total services exports, but Brazil's ranking is much higher for ICT exports than its rank of eighth-largest export market for total services exports.

Exports of ICT services to Europe grew to \$27.7 billion in 2014 from \$14.5 billion in 2006, representing an average annual growth rate of 8.4 percent (chart 7).¹¹ More than half of the increase in ICT services ex-

ports to Europe over that period was due to an increase in charges for the use of computer software in 2007, particularly to Ireland and to the United Kingdom. Exports of ICT services to other top destinations also grew strongly from 2006 to 2014. Exports to Asia and Pacific grew at an average annual rate of 5.7 percent. Exports to Latin America and Other Western Hemisphere grew at an annual average rate of 16 percent.

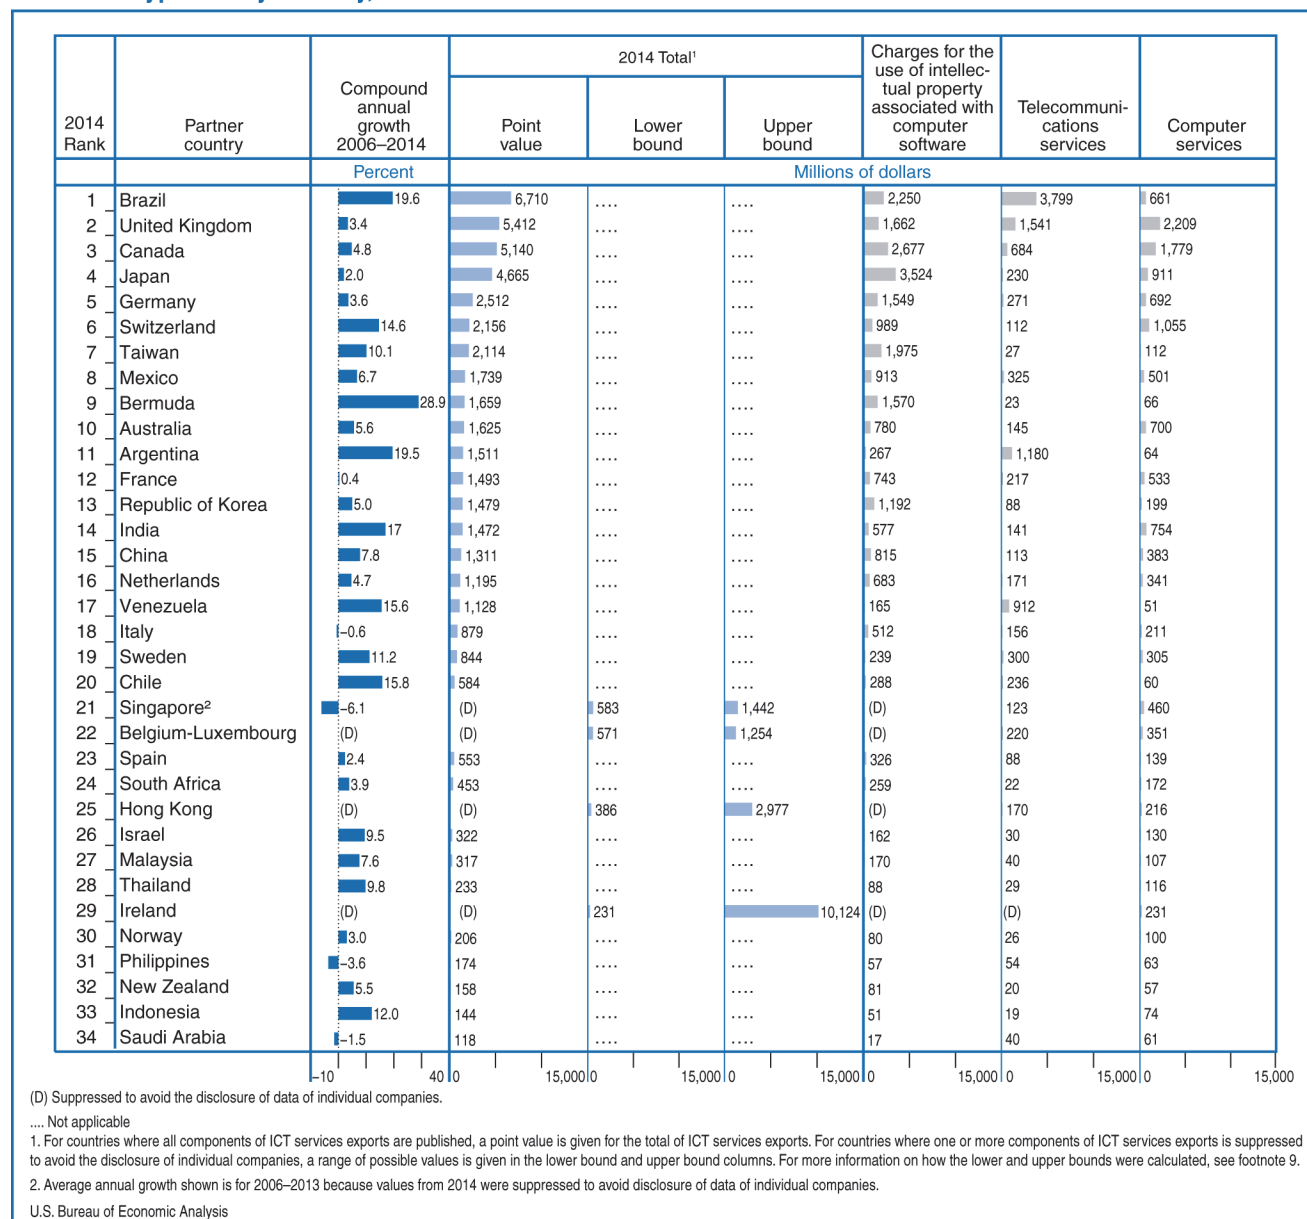

Potentially ICT-enabled services

As with ICT services exports, Europe was the largest regional destination for U.S. exports of potentially ICT-enabled services in 2014, followed by Asia and Pacific and by Latin America and Other Western Hemisphere (table E and chart 8). For three regions potentially ICT-enabled services accounted for half or

10. Ireland has also historically been an important market for ICT services exports, but the values of exports of various components of ICT services exports have been suppressed since 2010 to avoid the disclosure of data of individual companies. In 2014 the upper bound for ICT services exports to Ireland was 10,124, which was larger than exports to the United Kingdom, the top market identified using available data.

11. The year 2006 was the first for which BEA has published data on trade in services by type and by country that allow for ICT services by partner country to be calculated from published statistics.

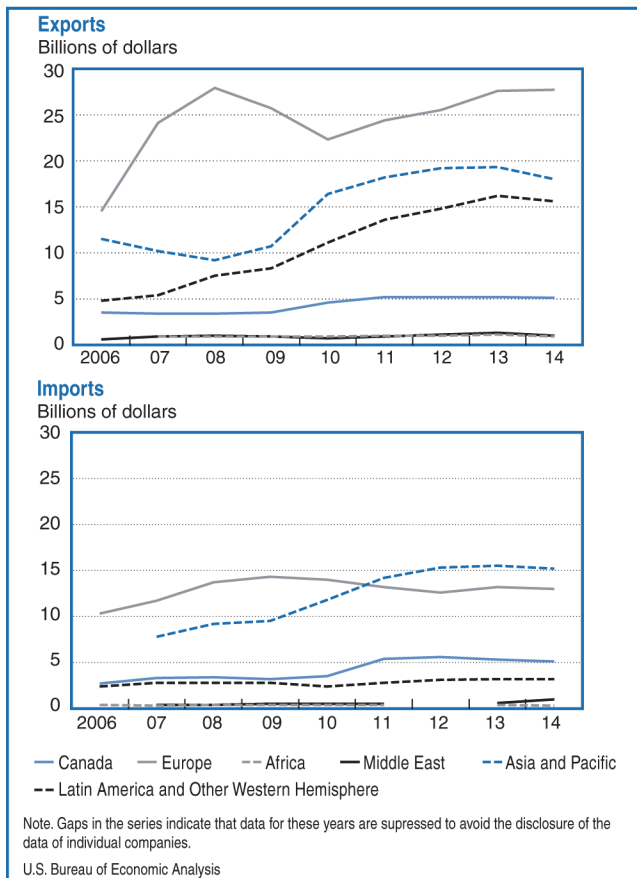

Chart 6. Growth in Exports of ICT Services by Country, 2006–2014 and Exports of ICT Services by Major Category of Service Type and by Country, 2014

more of all services exports: Europe (68.7 percent), Latin America and Other Western Hemisphere (50.7 percent), and Africa (50.0 percent). Potentially ICT-enabled services exports accounted for the lowest regional share in the Middle East (40.1 percent). By country, the top five destinations of potentially ICT-enabled exports in 2014 were the United Kingdom, Ireland, Canada, Japan, and Switzerland (chart 9). These countries were also among the top seven markets for total services exports in 2014.

Exports of potentially ICT-enabled services to the top regional destination, Europe, grew to \$183.7 billion in 2014 from \$111.2 billion in 2006, representing an average annual growth rate of 6.5 percent (chart 10). Exports of potentially ICT-enabled services to other top regional destinations also grew strongly from 2006 to 2014. Exports of potentially ICT-enabled services to Asia and Pacific grew by an average annual rate of 8.9 percent. Exports to Latin America and Other Western Hemisphere grew at an average annual rate of 9.8 percent.

Chart 7. Trade in ICT Services by Major Area, 2006–2014

U.S. imports

ICT services

Asia and Pacific was the largest regional source for U.S. imports of ICT services in 2014, followed by Europe (table E and chart 11). The two regions were ranked in the reverse order for total services imports. The regions where the largest shares of total services imports were accounted for by ICT services were Canada (16.9 percent) and Asia and Pacific (12.3 percent). Latin America and Other Western Hemisphere (3.4 percent) and Africa (3.5 percent) had the lowest shares (table E). The top five countries of origin for ICT imports in 2014 were India, Canada, the United Kingdom, Ireland, and Mexico (chart 12). Although these countries were also among the top ten countries of origin for total services imports in 2014, the rank ordering is quite different. India ranked seventh and Canada ranked fourth for total services imports.

Imports of ICT services from the top region of origin, Asia and Pacific, grew to \$15.2 billion in 2014 from \$7.8 billion in 2007, representing an average annual growth rate of 9.9 percent (chart 7).¹² Nearly all of the increase over that period was due to an increase in computer services. In contrast, imports of ICT services from Europe grew more slowly, growing at an average annual rate of 3.0 percent from 2006 to 2014, which led to Asia and Pacific overtaking Europe as the top region of origin for ICT imports in 2011.

12. The year 2007 was the first for which BEA has published data on trade in services by type and by country that allow for ICT services imports from Asia and Pacific to be calculated from published statistics.

Chart 8. Potentially ICT-Enabled Services Exports by Major Area, 2014

Potentially ICT-enabled services

Europe was the largest regional source for imports of potentially ICT-enabled services in 2014, followed by Asia and Pacific and Latin America and Other Western Hemisphere (table E and chart 13). Potentially ICT-enabled services accounted for a majority of all services

imports (52.7 percent) from Europe and just under half of all imports from Canada (49.8 percent) and Latin America and Other Western Hemisphere (49.0 percent) (table E). The top five countries of origin of potentially ICT-enabled imports in 2014 were the United Kingdom, Bermuda, India, Japan, and

(D) Suppressed to avoid the disclosure of data of individual companies.

.... Not applicable

1. For countries where all components of potentially ICT-enabled services exports are published, a point value is given for the total of potentially ICT-enabled services exports. For countries where one or more components of potentially ICT-enabled services exports is suppressed to avoid the disclosure of individual companies, a range of possible values is given in the lower and upper bound columns. For more information on how the lower and upper bounds were calculated, see footnote 9.

2. The category technical, trade-related, and other business services reflects only the services types that are considered potentially ICT-enabled.

3. Average annual growth shown is for 2006–2013 because values from 2014 were suppressed to avoid disclosure of data of individual companies.

4. Average annual growth shown is for 2007–2014 because values from 2006 were suppressed to avoid disclosure of data of individual companies.

U.S. Bureau of Economic Analysis

Switzerland. These countries were all in the top seven countries of origin for total services imports in 2014.

Imports of potentially ICT-enabled services from the top region of origin, Europe, increased to \$106.9 billion in 2014 from \$73.9 billion in 2006, representing an average annual growth rate of 4.7 percent (chart 10). Imports of potentially ICT-enabled services from other top regions of origin also grew strongly over this period. Imports from Asia and Pacific grew at an aver-

age annual rate of 9.5 percent. Imports from Latin America and Other Western Hemisphere grew at an average annual rate of 7.4 percent.

U.S. trade balance

ICT services

In 2014, the largest surpluses by region in ICT services were with Europe and with Latin America and Other Western Hemisphere (table E). The United States also had surpluses in ICT services with Asia and Pacific, Africa, and Canada and a deficit with the Middle East. In contrast, the largest surplus for total services was with Asia and Pacific. The five largest surpluses in ICT services were with Brazil, Japan, the United Kingdom, Taiwan, and Bermuda (chart 15). The largest deficit was with India, which was more than accounted for by a deficit in computer services.

Chart 10. Trade in Potentially ICT-Enabled Services by Major Area, 2006–2014

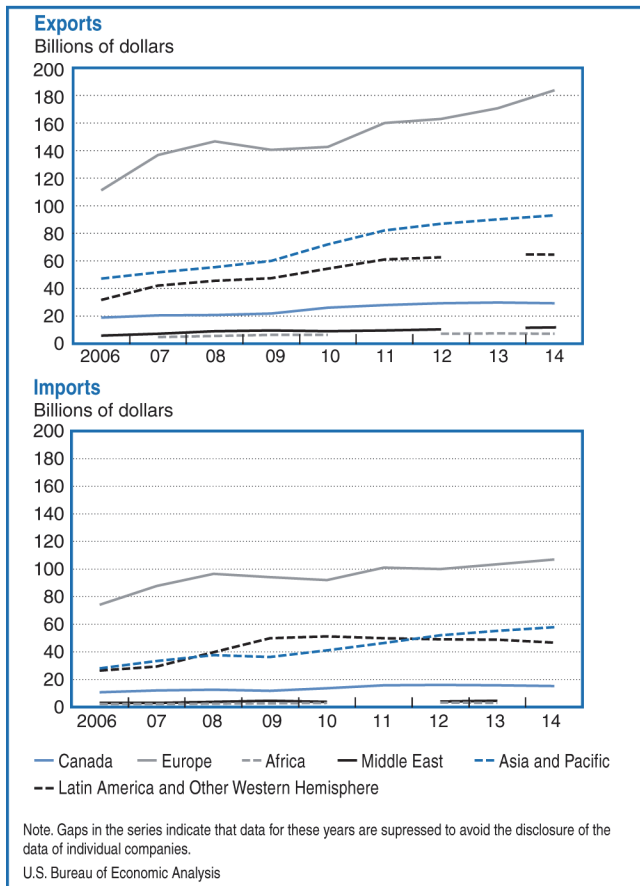

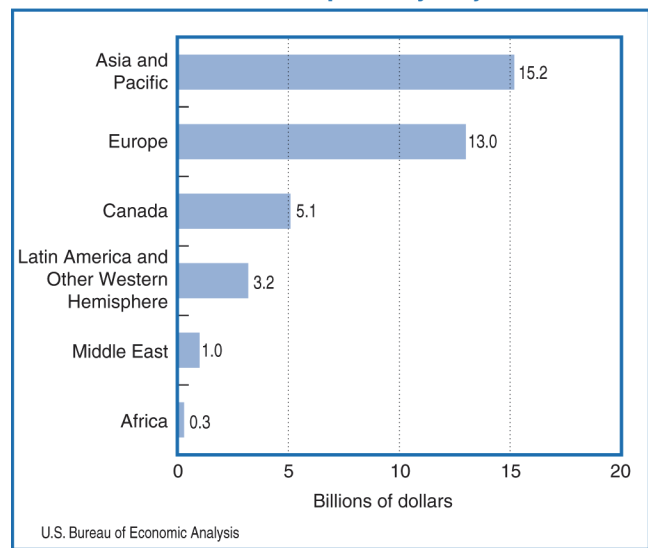

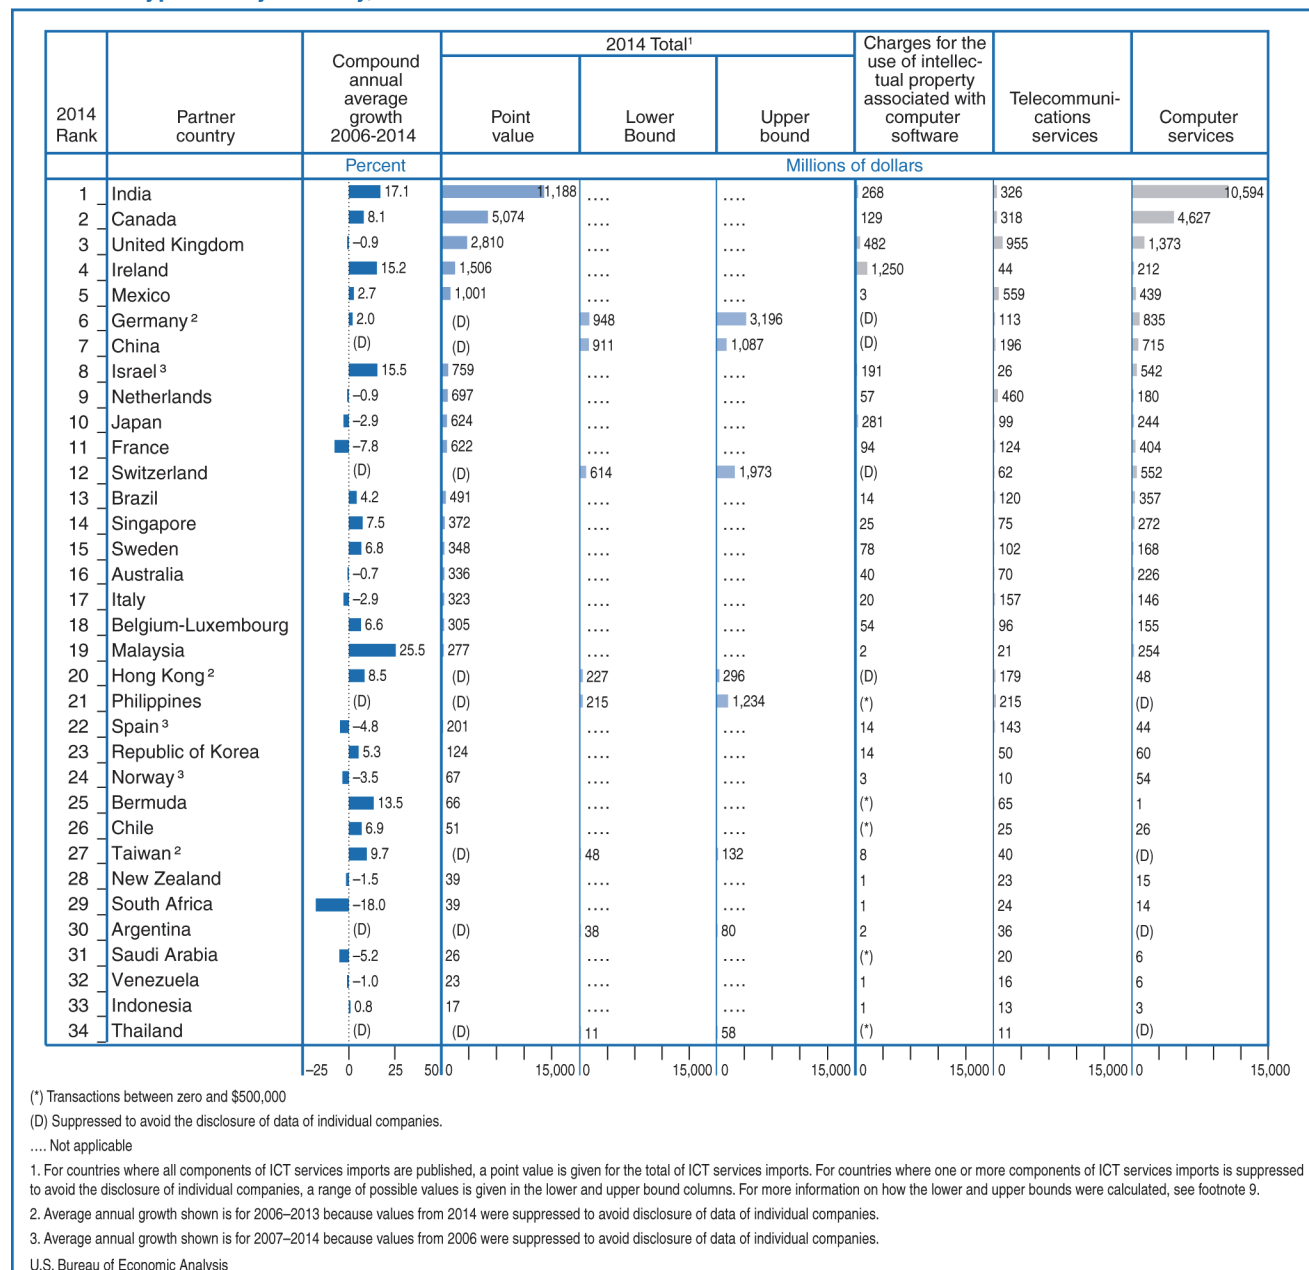

Chart 11. ICT Services Imports by Major Area, 2014

The surplus on ICT services from Europe grew to \$14.7 billion in 2014 from \$4.2 billion in 2007. Most of the increase over that period was in charges for the use of intellectual property associated with computer software and in computer services. The surplus in Latin America and Other Western Hemisphere also grew sig-

Chart 12. Growth in Imports of ICT Services by Country, 2006–2014 and Imports of ICT Services by Major Category of Service Type and by Country, 2014

nificantly, to \$12.4 billion from \$2.4 billion; an increase in the surplus with Brazil accounted for nearly half of the increase.

Potentially ICT-enabled services

The largest surpluses by region in potentially ICT-enabled services in 2014 were with Europe and Asia and Pacific. Total services trade surpluses for these two regions were ranked in the reverse order. The United States also had surpluses on potentially ICT-enabled services with Latin America and Other Western Hemisphere, Canada, the Middle East, and Africa.¹³ The five largest trade surpluses in potentially ICT-enabled imports in 2014 were with Ireland, Canada, the United Kingdom, Korea, and China (chart 16). The largest deficits were with Bermuda and India.

The surplus on potentially ICT-enabled services from the region with the largest surplus, Europe, increased to \$76.8 billion in 2014 from \$37.3 billion in 2006. The surplus on potentially ICT-enabled services with Asia and Pacific increased to \$35.3 billion from

13. Imports of potentially ICT-enabled services from the Middle East and Africa were suppressed to avoid the disclosure of data from individual companies in 2014, but based on the range of possible values for the trade balance in potentially ICT-enabled services (\$3.4–\$6.8 billion for the Middle East and \$3.3–\$5.3 billion for Africa), the United States had a trade surplus with both regions. See footnote 9 for an explanation of how the range of values was calculated.

\$19.1 billion. In Asia and Pacific, increases in the surpluses in ICT services with China (\$8.0 billion in 2014 from \$2.1 billion in 2006), Australia (\$7.6 billion from \$2.5 billion), and Korea (\$8.3 billion from \$3.8 billion) together exceeded an increase in the deficit with India (\$13.3 billion from \$3.5 billion).

Chart 13. Potentially ICT-Enabled Services Imports by Major Area, 2014

(*) Transactions between zero and \$500,000

(D) Suppressed to avoid the disclosure of data of individual companies.

.... Not applicable

1. For countries where all components of potentially ICT-enabled services imports are published, a point value is given for the total of potentially ICT-enabled services imports. For countries where one or more components of potentially ICT-enabled services imports is suppressed to avoid the disclosure of individual companies, a range of possible values is given in the lower and upper bound columns. For more information on how the lower and upper bounds were calculated, see footnote 9.

2. The category technical, trade-related, and other business services reflects only the services types that are considered potentially ICT-enabled.

3. Average annual growth shown is for 2006–2013 because values from 2014 were suppressed to avoid disclosure of data of individual companies.

4. Average annual growth shown is for 2007–2014 because values from 2006 were suppressed to avoid disclosure of data of individual companies.

U.S. Bureau of Economic Analysis

Defining ICT and Potentially ICT-Enabled Trade in Services—Continues

Guidance on standards for internationally comparable statistics on ICT and ICT-enabled services has been by the United Nations Conference on Trade and Development (UNCTAD) Task Group on Measuring Trade in ICT Services and ICT-Enabled Services.¹ The task group's October 2015 report is the first to offer a detailed classification of ICT-enabled services based on existing international statistical guidelines for compiling trade in services statistics, including the United Nations' *Manual on Statistics of International Trade in Services 2010* (MSITS) and the *International Monetary Fund's Balance of Payments and International Investment Position Manual, Sixth edition*.²

ICT services

ICT services are those that are “intended to enable and/or fulfill the function of information processing and communication.”³ UNCTAD identified a number of industries in the *International Standard Industrial Classification of All Economic Activities (ISIC) Revision 4* that should be classified as ICT services industries. To facilitate the production of detailed statistics on trade in ICT services, UNCTAD also proposed a corresponding grouping of ICT services categories based on the Extended Balance of Payments Services classification (EBOPS 2010) established by MSITS. In BEA's published statistics on international trade in services, these services types are telecommunications services, computer services, and charges for the use of intellectual property associated with computer software, as shown in the blue shaded rows of table A.

For 1999–2005, statistics on services trade that reflect charges for the use of intellectual property associated with computer software are not available because of source data limitations. However, published statistics are available for its parent category, charges for the use of intellectual property n.i.e. and for one subcomponent of that parent category not considered an ICT service, charges for the use of movies and television programming. To provide estimates of ICT trade for these years, these data were used to calculate a range of possible values for ICT exports and imports for each year in 1999–2005. The lower bound of the range is equal to the sum of telecommunications and computer services and the upper bound is equal to the sum of telecommunications services, computer services, and charges for the use of intellectual property n.i.e. less charges for the use of movies and television programming. The data were

also used to calculate a point estimate for 1999–2005 ICT services by multiplying charges for the use of intellectual property associated with computer software's 2006 share of nonmovie/television programming charges for the use of intellectual property n.i.e. (0.32 for exports and 0.13 for imports) by the value of nonmovie/television programming charges for the use of intellectual property n.i.e. in the earlier years. An example of these calculations for 2005 is shown in chart I, and the point estimates and the range of possible values for 1999–2005 are shown by the dotted lines and shaded areas extending from the solid line graphs of ICT services exports and imports in chart 2 on page 2.

Chart I. Estimation of ICT Services in 2005

Potentially ICT-enabled services

ICT-enabled services are “services that are delivered remotely over ICT networks” and “include activities that can be specified, performed, delivered, evaluated and consumed electronically.”⁴ This broad definition includes a variety of types of services, excluding those services types that necessarily involve the movement of physical objects or people or those that require face-to-face contact. Unlike ICT services, it is not possible to identify precisely ICT-enabled services using the EBOPS 2010 classification because the EBOPS classification system is based on the types of services traded, not the mode of delivery of the service. UNCTAD therefore recommends measuring a related concept, *potentially* ICT-enabled services, which

1. The definitions are from Sturgeon, Fredriksson, Fondeur, and Korka.

2. *Manual on Statistics of International Trade in Services* (Geneva: United Nations Department of Economic and Social Affairs, 2010) and *Balance of Payments and International Investment Position Manual Sixth Edition* (Washington, DC: International Monetary Fund, 2009).

3. Sturgeon, Fredriksson, Fondeur, and Korka, 3, paragraph 6.

4. Sturgeon, Fredriksson, Fondeur, and Korka, 3, paragraph 8, and 9, paragraph 22.

Defining ICT and Potentially ICT-Enabled Trade in Services—Ends

includes service types that *can* predominantly be delivered remotely over ICT networks, a subset of which are *actually* delivered via that method. Potentially ICT-enabled services include ICT services as well as other potentially ICT-enabled services and correspond to the following services types in BEA’s published statistics on international trade in services: insurance services; financial services; charges for the use of intellectual property n.i.e.; telecommunications, computer, and information services; and certain services included in other business services, including professional and management consulting services and research and development. Potentially ICT-enabled services include ICT services. The full list of services types identified as being potentially ICT-enabled is shown by the shaded (yellow and blue) rows in table A.

For 1999–2005, statistics on services trade for the service types within technical, trade-related, and other business services are not available because of source data limitations. However, published statistics are available for technical, trade-related, and other business services as a whole and for a separate subcomponent of that parent category not considered potentially ICT-enabled, operating leasing services. These two series were used to calculate a range of possible values for potentially ICT-enabled exports and imports, with the lower bound equal to the sum of insurance services, financial services, charges for the use of intellectual property n.i.e., telecommunications, computer, and information services, professional and management consulting services, and research and development services and the upper bound equal to the sum of those categories as well as technical, trade-related, and other business services less operating leasing services. A point estimate for potentially ICT-enabled services was also calculated for 1999–2005 by identifying the share of technical, trade-related,

and other business services less operating leasing services considered potentially ICT-enabled in 2006 (0.73 for exports and 0.68 for imports), and multiplying that share by the value of technical, trade-related, and other business services less operating leasing in 1999–2005. An example of these calculations for 2005 is shown in chart II, and the point estimates and range of possible values for 1999–2005 are shown by the dotted lines and shaded areas extending from the solid line graphs of potentially ICT-enabled services exports and imports in chart 2 on page 2.

Chart II. Estimation of Potentially ICT-Enabled Services in 2005

Tables 1 through 8 accompany this article.

1. Insurance services transactions are considered to be unaffiliated even when they are between affiliated companies because the services are considered to be provided to the policyholders who pay the insurance premiums and who are unaffiliated with either company. The only insurance services considered to be affiliated are primary insurance transactions between a U.S. company that is not an insurance company and an affiliated foreign insurance company,

such as a captive foreign insurance affiliate. Data on these affiliated insurance services are not separately available.

2. Transactions in basic telecommunications services are considered to be unaffiliated, even when the services flow through affiliated channels, because they represent the distribution of revenues collected from unaffiliated customers. Other types of telecommunications services, such as value-added services, may flow through either affiliated or unaffiliated channels, and are recorded accordingly.

NOTE. The shading indicates that the values are estimated using the methods described in the box "Defining ICT and Potentially ICT-Enabled Trade in Services."

Innovation-Related Services Trade by Multinational Enterprises Results from an Interagency Data Link Project

By Francisco Moris and William J. Zeile

This article presents new data on multinational enterprises (MNEs) located in the United States that engage in both research and development (R&D) and international trade in innovation-related services. The data show that these MNEs are more R&D-intensive in terms of employment than MNEs that perform R&D but do not engage in innovation-related services trade. The data also show differences in trade balances in different types of innovation-related services between R&D-performing U.S. parent companies of U.S. MNEs and R&D-performing U.S. affiliates of foreign MNEs.

MULTINATIONAL ENTERPRISES (MNEs) with a presence in the United States economy—both U.S. parent companies of U.S. MNEs and U.S. affiliates of foreign MNEs—are major contributors to U.S. technological innovation, as evidenced by their research and development (R&D) activity. An earlier article presented results from an interagency project that linked company information from BEA's annual activities of MNE (AMNE) surveys to company-specific information from the Business R&D and Innovation Survey (BRDIS), which is cosponsored by the National Science Foundation (NSF) and the U.S. Census Bureau. Results from that link indicate that in 2010, the share of total U.S. domestic R&D performance accounted for by U.S. parent companies was 71 percent, and the share accounted for by foreign-owned U.S. affiliates was 14 percent.¹

Given that MNEs are increasingly fragmenting their global production and supply chains (Johnson and Noguera) and extending the geographic scope of their R&D and innovation-related activities (Hall), a commensurate rise might be expected in their cross-border trade in intermediate services.² This may be particularly true for trade in services related to R&D and for

charges for the use of intellectual property. Information on U.S. trade in services by MNEs for 2008 was obtained earlier from a BEA project that linked company information from its AMNE surveys to transactions data from its surveys of international trade in services.³

Building on these separate two-way link projects, a new interagency three-way link project was recently completed involving BRDIS, the AMNE surveys, and the BEA BE-125 quarterly survey of Transactions in Selected Services and Intellectual Property With Foreign Persons. The three-way link results in integrated information for matched U.S. parent companies and majority-owned U.S. affiliates that engage in both R&D and trade in innovation-related services. These services include R&D services, industrial engineering services, and charges for the use of intellectual property, including industrial processes and trademarks.⁴ The interagency project aims to improve and enhance the data available on the R&D and innovation activities of MNEs. The project was initiated and funded by the National Center for Science and Engineering Statistics (NCSES) of the NSF and was implemented under an agreement reached by NSF, the Census Bureau, and BEA.

The data project provides new integrated information on the R&D performance, R&D employment, trade in R&D services, and international charges for the use of intellectual property for the subset of MNEs operating in the United States (U.S. parent companies and majority-owned U.S. affiliates) that engage in both R&D and the selected international trade in services covered for 2010.⁵ Among the illustrative findings from the project, matched MNEs that report activity

1. See Francisco Moris, "R&D Performance of U.S.-Located Multinational Companies: Results from Multiagency Survey Linking Project," *InfoBriefs* (February 2016). As noted in "Data Notes" in this report, the shares for U.S. parents and U.S. affiliates are not mutually exclusive because some U.S. parent companies are also foreign-owned affiliates.

More information about data link projects is available on [BEA's Web site](#).

2. Robert C. Johnson and Guillermo Noguera, "Accounting for Intermediates: Production Sharing and Trade in Value Added," *Journal of International Economics* 86, no. 2 (March 2012): 224–236, and Bronwyn H. Hall, "The Internationalization of R&D" 2010.

3. See Kevin Barefoot and Jennifer Konz-Bruner, "A Profile of Exporters and Importers of Services: Evidence From New Linked Data on International Trade in Services and Operations of Multinational Companies," *SURVEY OF CURRENT BUSINESS* 92 (June 2012).

4. Data from the three-way link on trade in industrial engineering services are not presented in this article because much of the tabular data from the project was suppressed to avoid disclosure of information on individual companies.

5. For the data year 2010 covered in the link project, trade in R&D services was collected as "research, development, and testing services." Trade in these services is currently reported as "trade in research and development services" on line 46 (exports) and line 114 (imports) of table 2.1 in the international transactions accounts.

on all three research-related surveys are more R&D intensive in their employment than other U.S.-located R&D performing companies and MNEs that perform U.S. R&D but do not engage in innovation-related services trade. Matched U.S. parent companies that report on all three surveys account for dominant shares of total U.S. trade connected with both charges for the use of intellectual property and R&D services.

Results for U.S. Parent Companies

U.S. parent companies that engage in both domestic R&D and international trade in innovation-related services were responsible for \$162.9 billion in domestic U.S. R&D performance in 2010 (table 1).⁶ Their R&D performance accounted for 58 percent of the total \$279.0 billion in domestic R&D performed by all U.S.-located companies and for 83 percent of the total \$197.2 billion in domestic R&D by R&D-performing U.S. parent companies identified in the two-way link. About 80 percent of the domestic R&D performance of U.S. parent companies in the three-way link was by

6. In table 1, the figures on R&D and employment for matched companies in the three-way link include companies whose trade in innovation-related services consisted solely of trade in industrial engineering services. The trade data for this service category are not presented in the other tables because of suppressions to avoid disclosure of information on individual companies.

parent companies classified in manufacturing.⁷

The domestic R&D labor force of U.S. parent companies in the three-way link was approximately 602,000 employees. These employees accounted for 43 percent of the domestic R&D employment of all R&D-performing U.S. companies and for 76 percent of the domestic R&D employment of R&D-performing U.S. parent companies identified in the two-way link. For U.S. parent companies in the three-way link, their domestic R&D employment accounted for 8.5 percent of their total domestic employment, which is higher than both the 7.6 percent R&D-employment share for all R&D-performing companies located in the United States and the 6.9 percent R&D-employment share for R&D-performing U.S. parent companies identified in the two-way link.

U.S. parent companies in the three-way link accounted for dominant shares of both U.S. exports and U.S. imports of R&D services. Their share of imports was 84 percent, substantially higher than their 63 percent share of exports (table 2). Imports of R&D services by the matched U.S. parent companies, which totaled \$18.5 billion, exceeded their exports of R&D

7. A forthcoming NSF *InfoBrief* (to be released on the [NSF Web site](#)) will discuss additional BRDIS information based on the three-way link.

Table 1. R&D Performance and Employment of All R&D-Performing U.S. Companies and for Matched Companies in Two-Way and Three-Way Links, 2010

	Millions of dollars	Thousands	Percentage of all-companies total		Addendum: R&D employment as a percentage of total employment
	Domestic R&D performance	Domestic R&D employment	Domestic R&D performance	Domestic R&D employment	
All U.S.-located companies that perform R&D (BRDIS estimates)	278,977	1,412	100.0	100.0	7.6
U.S. parent companies that perform R&D (two-way link)	197,163	788	70.7	55.8	6.9
U.S. parent companies that perform R&D and engage in services trade (three-way link)	162,902	602	58.4	42.6	8.5
Majority-owned U.S. affiliates that perform R&D (two-way link)	39,700	155	14.2	11.0	7.3
Majority-owned U.S. affiliates that perform R&D and engage in services trade (three-way link)	31,973	116	11.5	8.2	9.0

NOTES. Data for all U.S.-located companies are from the full 2010 BRDIS. Three-way link refers to BRDIS-US/DIA-trade in services link and BRDIS-FDI/US-trade in services link. For an illustration of two-way and three-way links, see chart 1. R&D services for 2010 include transactions in testing services.

Data for matched U.S. parent companies and matched majority-owned U.S. affiliates (U.S.-located foreign-owned companies) should not be summed to attempt a U.S. aggregate related to MNEs because some U.S.

parent companies of foreign affiliates are themselves owned by a foreign parent company. Linked data are not weighted. Detail may not add to total because of rounding.

Table 2. U.S. Trade in Selected Services for All U.S. Companies and for Matched Companies in Three-Way Links by Type of Service, 2010

	Millions of dollars			Percent		
	All U.S. companies	Matched U.S. parents	Matched U.S. affiliates	All U.S. companies	Matched U.S. parents	Matched U.S. affiliates
Exports:						
Charges for the use of intellectual property	107,521	93,003	7,672	100.0	86.5	7.1
<i>Of which:</i>						
Industrial processes	36,333	33,818	4,185	100.0	93.1	11.5
Trademarks	14,340	10,930	360	100.0	76.2	2.5
Research and development services	22,446	14,231	7,018	100.0	63.4	31.3
Imports:						
Charges for the use of intellectual property	32,551	20,394	15,219	100.0	62.7	46.8
<i>Of which:</i>						
Industrial processes	18,847	13,499	9,880	100.0	71.6	52.4
Trademarks	4,524	2,103	3,111	100.0	46.5	68.8
Research and development services	22,170	18,517	2,358	100.0	83.5	10.6

NOTES. Data for all U.S. companies are from BEA's survey of transactions in selected services and intellectual property with foreign persons. "Three-way links" refers to BRDIS-US/DIA-services trade link and BRDIS-FDI/US-services trade link. For an illustration of two-way vs. three-way links, see Figure 1. R&D services for 2010 include transactions in testing services. Data for matched U.S. parent companies and matched majority-owned U.S. affiliates (U.S.-located foreign-owned companies) should not be summed to attempt a U.S. aggregate

related to MNEs because some U.S. parent companies of foreign affiliates are themselves owned by a foreign parent company. Linked data are not weighted. Detail may not add to total because of rounding.

Sources: National Science Foundation, National Center for Science and Engineering Indicators, U.S. Bureau of Economic Analysis, and U.S. Census Bureau, R&D Data Link Project 2008–2010.

services of \$14.2 billion, in contrast to the positive U.S. trade balance in R&D services for all companies in 2010. Trade in R&D services, however, is only one of the channels through which U.S. parents can deliver their innovation-related services to foreigners. As will be shown later, parents had a large positive balance on their trade in other services.

Slightly more than half of the imports of R&D services by the linked U.S. parent companies were by parent companies in manufacturing, and another 40 percent were by those in information (table 3). Exports of R&D services by the matched U.S. parent companies were predominantly by manufacturing companies; these companies accounted for slightly more than 80 percent of these exports. This share is comparable with manufacturing's share of the domestic R&D performance of parent companies. For both exports and imports, trade in R&D services by the matched U.S. parent companies was predominantly with their foreign affiliates.

U.S. parents' trade in R&D services reflects both services performed by one unit of the MNE for another and allocated expenses related to the firm's R&D. Imports of R&D services by U.S. parents are likely to reflect reimbursement of foreign affiliates for their R&D expenses, cost-sharing arrangements for the development of new technology by affiliates, or payments for services provided to the parent. A substantial amount of R&D is conducted by foreign affiliates of U.S. MNEs to meet local tastes or to benefit from proximity to new

sources of knowledge or talent.⁸

In contrast to their negative balance in R&D services, U.S. parent companies matched in the three-way link had a large positive balance in charges for the use of intellectual property in 2010. The linked U.S. parents' receipts (exports) of \$93.0 billion exceeded their payments (imports) of \$20.4 billion by more than fourfold (table 2). Matched U.S. parents accounted for 86 percent of U.S. receipts for the use of intellectual property abroad, a share substantially above their 63 percent share of U.S. payments for the use of foreign intellectual property.

About a third of the total receipts of matched U.S. parents for charges for the use of their intellectual property consisted of charges for industrial processes, and another ninth consisted of charges for trademarks. The remaining receipts consisted of charges for computer software, franchise fees, audiovisual and related products (including movies and television programming, books and sound recordings, and broadcasting and recording of live events), and other intellectual property.⁹ The matched U.S. parents accounted for 93 percent of total U.S. receipts for industrial processes

8. See, for example, Walter Kuemmerle, "The Drivers of Foreign Direct Investment into Research and Development: An Empirical Investigation," *Journal of International Business Studies* 30, no. 1 (First Quarter of 1999): 1–24 and Heather Berry and Aseem Kaul, "Global Sourcing and Foreign Knowledge Seeking: A Formal Model and Empirical Analysis," forthcoming in *Management Science*.

9. Detail on these other subcategories of charges for the use of intellectual property was not tabulated for the data from the three-way links.

NOTES. "Three-way link" refers to BRDIS-USDA-services trade link. For an illustration of two-way vs. three-way links, see Figure 1. R&D services for 2010 include transactions in testing services. Data are not weighted. Detail may not add to total because of rounding. Industry classification is based on BRDIS according to dominant business code for domestic R&D performance where available. For companies that did not report busi-

ness codes, classification used for BRDIS was assigned. Sources: National Science Foundation, National Center for Science and Engineering Indicators, U.S. Bureau of Economic Analysis, and U.S. Census Bureau, R&D Data Link Project 2008–2010.

and for 76 percent of total U.S. receipts for trademarks.

Almost all of the matched parent receipts for charges for the use of intellectual property were accounted for by parents in the manufacturing and information industries (table 3). The share for the information industry was about the same as the share for manufacturing, each just under 50 percent. Matched parents in manufacturing alone accounted for 87 percent of the receipts for both industrial processes and trademarks in the three-way link.

Charges for industrial processes accounted for two-thirds of the payments (imports) for charges for the use of intellectual property by matched U.S. parent companies (table 2). Charges for trademarks accounted for 10 percent. Matched U.S. parents accounted for a dominant share (72 percent) of total U.S. payments for industrial processes, but they accounted for less than half of U.S. payments for trademarks.

About three-fourths of the payments for charges for the use of intellectual property by matched parent companies was by parent companies in manufacturing, and an additional fifth was by parents classified in the information industry (table 3). Parents in manufacturing accounted for almost all of the linked-parent payments for industrial processes and for more than 80 percent of the linked-parent payments for trademarks.

Results for U.S. Affiliates

Majority-owned U.S. affiliates that engage in both R&D and trade in services performed \$32.0 billion in domestic U.S. R&D in 2010. They accounted for 12 percent of the domestic R&D performance of all U.S.-located companies and 81 percent of domestic R&D

performance of majority-owned U.S. affiliates that perform R&D identified in the two-way link (table 1). Affiliates in manufacturing conducted almost 90 percent of the domestic R&D performance of affiliates in the three-way link.

The domestic R&D labor force of majority-owned U.S. affiliates in the three-way link was approximately 116,000 employees. These employees accounted for 8 percent of the domestic R&D employment of all R&D-performing U.S. companies and for 75 percent of the domestic R&D employment of matched R&D-performing U.S. affiliates in the two-way link. For U.S. affiliates in the three-way link, their R&D employment accounted for 9.0 percent of their total domestic employment, which is higher than both the 7.6 percent R&D-employment share for all R&D-performing U.S. companies and the 7.3 percent share for R&D-performing U.S. affiliates identified in the two-way link.

In contrast to the linked U.S. parent companies, majority-owned U.S. affiliates in the three-way link had a large positive balance in R&D services. Their exports were \$7.0 billion and accounted for 31 percent of total U.S. exports of R&D services. Their imports were \$2.4 billion and accounted for 11 percent of total U.S. imports of R&D services (table 2). Three-fourths of their exports of R&D services were by affiliates in manufacturing, and another fifth were by affiliates in professional, scientific, and technical services (table 4). More than 90 percent of their imports of R&D services were by affiliates classified in manufacturing. Foreign MNEs often find the United States to be an attractive location for their R&D activities because of the access to new sources of knowledge, a supply of skilled labor, and opportunities for collaboration through proximity to

leading universities and clusters of industrial research activity.¹⁰

In trade connected with charges for the use of intellectual property, the matched U.S. affiliates ran a negative trade balance. Their payments (imports) of \$15.2 billion were twice as large as their receipts (exports) of \$7.7 billion (table 2). Their payments accounted for almost half of all U.S. payments for the use of intellectual property, while their receipts accounted for only 7 percent of all U.S. receipts for the use of intellectual property.

About two-thirds of the payments by matched U.S. affiliates for the use of intellectual property consisted of charges to the affiliates for industrial processes, and another 20 percent consisted of charges for trade-

10. See Berry and Kaul.

marks. Matched affiliates in the three-way link accounted for slightly more than half of total U.S. payments for the use of industrial processes and for about 70 percent of U.S. payments for the use of trademarks. For both industrial processes and trademarks, almost all of the payments by matched affiliates were charges to affiliates classified in manufacturing (table 4).

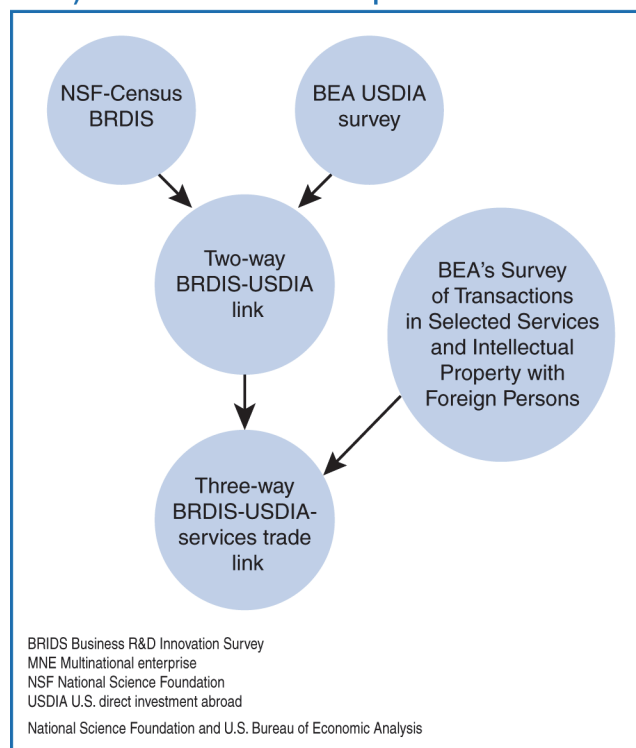

Slightly more than half of the receipts by matched affiliates for the use of intellectual property consisted of charges for industrial processes; charges for trademarks accounted for only 5 percent of the receipts. Affiliates in manufacturing accounted for about 80 percent of the receipts by matched affiliates for industrial processes; affiliates classified in the information industry accounted for most of the remaining receipts. Manufacturing affiliates also accounted for more than 85 percent of the receipts by matched affiliates for trademarks.

Methodology for the Data Link Project

The Business R&D and Innovation Survey (BRDIS) was linked with each of the two activities of MNE surveys from the Bureau of Economic Analysis—the survey of U.S. direct investment abroad (USDIA) and the survey of foreign direct investment in the United States (FDIUS). The master files from each of these two-way links (BRDIS-USDIA and BRDIS-FDIUS) for 2010 were then separately linked via common company identifications with microdata for the sum of the four quarters of 2010 from the BEA Survey of Transactions in Selected Services and Intellectual Property With Foreign Persons, resulting in three-way links for each of the MNE subsets covered in this article (U.S. MNE parent companies and majority-owned U.S. affiliates of foreign MNEs). Validity checks of matches and selected cross-survey data were performed using, for example, information from previous two-way links.

Linked data shown in this article are based on unweighted aggregates. See chart 1 for an illustration of the three-way link for matching U.S. MNE parent companies using BEA’s USDIA survey. Similar steps were performed to complete the three-way link for majority-owned U.S. affiliates of foreign MNEs using 2010 data from BEA’s FDIUS survey, BEA’s services trade survey, and BRDIS.

Chart 1. The ‘Three-Way Link’ (BRDIS-USDIA-Services Trade) for U.S. MNE Parent Companies

Conclusion

In 2010, domestic R&D employment as a share of total domestic employment was higher for MNEs in the United States that engaged in both R&D and international trade in innovation-related services than for MNEs that perform U.S. R&D but do not engage in U.S. innovation-related trade in services. U.S. MNE parent companies in the three-way link accounted for dominant shares of U.S. exports and imports of ser-

vices connected with both charges for the use of intellectual property and R&D services. Further, matched U.S. MNE parent companies had a large positive balance in charges for the use of intellectual property, but they had a negative balance in trade in R&D services. In contrast, the linked U.S. affiliates had a negative balance in trade connected with charges for the use of intellectual property but a positive balance in trade in R&D services.

Acknowledgments

The R&D link project underlying the integrated data presented in this article was initiated and funded by the National Center for Science and Engineering Statistics (NCSES) of the National Science Foundation (NSF).

At NSF, John E. Jankowski, Director of the Research and Development Statistics Program directed the agency portion of the project with the assistance of Francisco Moris, Senior Analyst. Jock Black, Mathematical Statistician, provided statistical input and review.

At the U.S. Census Bureau, Richard Hough, Assistant Chief for R&D and Special Surveys of the Economic Reimbursable Surveys Division, and Michael Flaherty, Chief of the Research, Development, and Innovation Surveys Branch, directed the Census Bureau's portion of the

project.

Jeffrey P. Kellner of the Census Bureau Research, Development, and Innovation Surveys Branch and Francisco Moris (NSF) performed the three-way microdata links and reviewed linked data and tabulations.

At the U.S. Bureau of Economic Analysis, Raymond Mataloni Jr., Assistant Chief for Research and Analysis of the Balance of Payments Division (BPD), directed the agency's portion of the project. Fritz Mayhew of the Merchandise Trade Branch of BPD prepared the BE-125 data files to be transferred to the Census Bureau for linking. Daniel Powell of the Operations Systems and Analysis Branch of the Direct Investment Division performed the disclosure analysis on the tabulations.

Research Spotlight

Identifying Firm Heterogeneity in Value Added and Trade for U.S. Businesses

By James J. Fetzer and Erich H. Strassner

This article discusses a new economic accounting framework for the United States that describes the production and sourcing patterns for different types of firms in an industry. The estimates show that domestic value added by an industry as a share of output is lower for globally engaged firms, compared with domestically oriented firms, and that exports and imports of goods as a share of output are larger for globally engaged firms.

THE GROWTH OF COMPLEX and increasingly fragmented supply chains in the global economy has increased trade in intermediate goods and services, some of which return to the sending country for final sale or for further processing. These changes have increased the interest in measuring the degree to which gross trade values reflect value added from the trading partner or from intermediate inputs sourced from other countries, including the home country. For example, Johnson and Noguera (2012) estimate that as much as two-thirds of gross trade is comprised of intermediate goods that pass a given customs frontier multiple times before becoming final goods and reaching their ultimate consumer. They also estimate that when bilateral trade flows are adjusted to include only trade in value added (TiVA), the United States-China bilateral trade deficit for goods and services is about 30 percent to 40 percent smaller and the United States-Japan deficit is about 33 percent larger.

However, national statistical agencies have found that directly measuring the degree to which trade flows contain value added from the immediate partner country, as opposed to intermediate inputs from other countries, is very difficult. The most popular approach to estimating TiVA is by using input-output (I-O) coefficients for the home country and for its major trading partners. The coefficients measure, for a given industry, the amount of each industry's output that is required as an intermediate input to produce one unit of output in that industry. These coefficients come from a global supply-use table (SUT), which decom-

poses total output for an industry into value added by firms in that industry and intermediate inputs that are sourced domestically or imported. There are multiple international efforts to develop the statistical infrastructure to develop TiVA estimates, including efforts by the Organisation for Economic Co-operation and Development, the Asia Pacific Economic Cooperation, the World Trade Organization, and the United Nations Statistics Division.¹

The underlying economic accounting framework in these efforts is the extended SUT. The key feature of this type of table that distinguishes it from a traditional SUT is the explicit accounting for firm-level heterogeneity. In a traditional SUT, firm heterogeneity is captured only by the disaggregation by industry. The extended SUT recognizes that even within an industry, there can be important firm heterogeneity. A consensus has not yet emerged in the literature on the most relevant firm characteristics to capture firm heterogeneity, but the Bureau of Economic Analysis (BEA) has chosen to focus on the degree of a firm's global engagement.² Researchers such as Melitz (2003) have demonstrated that globally engaged firms are more productive than their domestically oriented peers and have production functions that are significantly more reliant on exports and imports. In this research, globally engaged firms are U.S. businesses that are part of a U.S.-based or foreign-based multinational enterprise (MNE). Roughly 90 percent of trade in goods (Bernard, Jensen, and Schott (2009)) and more than 80 percent of trade in services (Barefoot and Koncz-Bruner (2012)) involve multinational enterprises. Accounting for firm-level heterogeneity will yield more informative TiVA and global value chain measures, as the aggregate production functions of industries in

1. For more information, see [the papers presented at the International Conference on Measurement of Trade and Economic Globalization](#).

2. For details about this research, see "Identifying Heterogeneity in the Production Components of Globally Engaged Business Enterprises in the United States."

national economy SUTs are decomposed into relevant sets of firm characteristics and as differences in TiVA are ascribed to these characteristics.

This Research Spotlight presents preliminary estimates that compare components of total output by industry and by firms' level of global engagement. The estimates show heterogeneity in the composition of output among different types of firms. They allow us to answer some important questions about the effects of globalization on the U.S. economy, such as the following:

- Which industries are more involved in global value chains?
- How much do MNEs contribute to the domestic economy by purchasing intermediate goods and services from other U.S. businesses?
- How much value do MNEs add to U.S. production?
- What types of firms are more likely to import and export?

Similar to this study for the United States, research that has analyzed the components of value added for other countries within a SUT framework has shown evidence of firm heterogeneity (for a broad group of countries, see Piacentini and Fortanier (2015), for Turkey, see Ahmad, Araújo, Lo Turco, and Maggioni (2013), and for China, see Ma, Wang, and Zhu (2015)). These studies found that value added by foreign-owned MNEs is a smaller share of output or sales than value added by domestic-owned firms in many, but not all, of the countries studied. Exceptions include only a few countries, such as Finland, Turkey, and for production of processing exports, China.³ Exports and imports as a share of output or turnover are typically larger on average for foreign-owned MNEs than for domestic-owned firms.

The estimates presented for the United States rely on source data from BEA and from other sources for 2011. Internal Revenue Service Statistics of Income (SOI) data are used to account for all firms with operations in the United States. All data for MNEs are based on comprehensive data on U.S. direct investment abroad and foreign direct investment in the United States that are collected from mandatory surveys conducted by BEA.⁴ These data cover both the operations

3. Processing exports are part of China's processing trade regime, which exempts materials imported for further processing and reexported from import duties. Value added is a larger share of output for processing exports produced by foreign-owned firms than processing exports produced by Chinese-owned firms because foreign-owned processing exports rely much less on Chinese produced inputs. See table 3 in Ma, Wang, and Zhu (2015).

4. See Scott (2015) and Ismaylov and Limes (2015) for recent descriptions of these data for 2013.

of MNEs with headquarters in the United States (domestic-owned MNEs) and U.S. affiliates of MNEs with headquarters abroad (foreign-owned MNEs). Results for domestic-owned non-MNEs are computed as the difference between the SOI data for all U.S. firms less the results for domestic-owned and foreign-owned MNEs. SOI data are used instead of data from BEA I-O tables because the SOI data are collected and published by industry at the enterprise level, similar to the BEA MNE data.

Results

The components of total output show heterogeneity in value added, imports, and exports as a share of output between the three types of firms: domestic-owned MNEs, foreign-owned MNEs, and non-MNEs. The patterns of the heterogeneity are consistent with other research.

In most broad industry groups, value added as a share of output is smallest for foreign-owned MNEs and largest for non-MNEs (tables 1 and 2 and chart 1). In particular, domestic value added as a share of output is

- Smaller for foreign-owned MNEs than for both domestic-owned MNEs and non-MNEs.
- About 10 percentage points larger on average for domestic-owned MNEs than for foreign-owned MNEs.
- Larger for domestic-owned MNEs, compared with foreign-owned MNEs in almost all industries, although the share varies across industries.

Table 1. Use Table for All Private Industries by Type of Firm, 2011
[Percentage of total output]

	Domestic-owned MNEs	Foreign-owned MNEs	Non-MNEs	Exports of goods	Other uses

MNEs Multinational enterprises

NOTE: The preliminary estimates presented in this table are provisional and are intended only for discussion and to illustrate the types of analysis that can be performed with this framework.

- At least 50 percent larger on average for non-MNEs than for MNEs.
 - Larger in labor-intensive industries such as health care and social assistance.
 - About 6–7 percentage points smaller on average for MNEs that export goods than those that do not, although this varies by industry.
 - Smaller for foreign-owned firms, compared with domestic-owned firms.
- Consistent with earlier BEA studies, such as Zeile

(1998), imports and exports as a share of output are larger on average for the foreign-owned MNEs, compared with domestic-owned firms, though these shares vary by industry (chart 2). In particular,

- Imports and exports as a share of output are larger for foreign-owned firms than domestic-owned firms.
- Imports as a share of output are 2–3 times larger on average for foreign-owned MNEs.
- Exports as a share of output are largest for foreign-

MNEs Multinational enterprises

NOTES. The preliminary estimates presented in this table are provisional and are intended only for discussion and to illustrate the types of analysis that can be performed with this framework. Some values for employee compensation and gross operating surplus for non-MNE firms are negative because of differences in the data sources used to calculate the values for non-MNE firms.

Chart 1. Value Added as a Share of Output by Type of Firm for Selected Industries, 2011

owned MNEs (9 percent) and smallest for non-MNEs (3 percent).

- Imports as a share of intermediates are larger on average (23 percent) for foreign-owned MNEs than for domestic-owned MNEs and non-MNEs (9 percent each).⁵

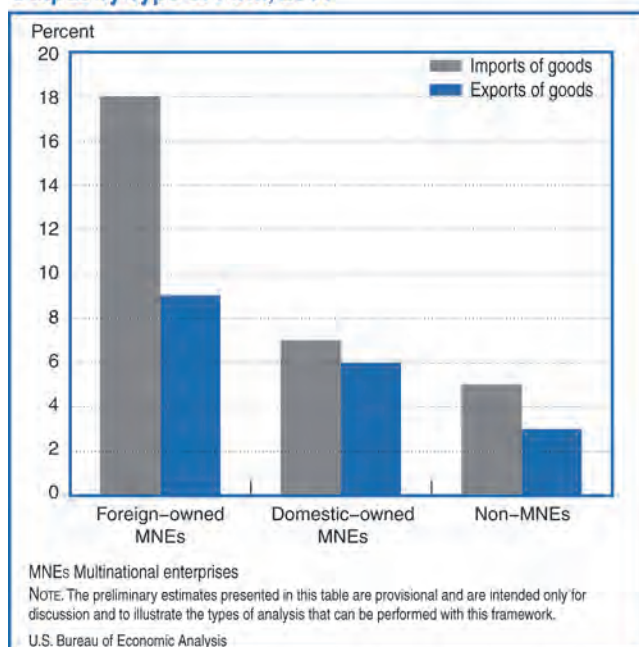

These preliminary results raise a number of interesting research questions, such as the following:

- Why is value added as a share of output for foreign-owned MNEs typically smaller than that for domestic-owned MNEs?
- Why is value added as a share of output larger for domestic-owned MNEs in manufacturing than for non-MNEs?
- What are the differences in the structure of production by different types of firms?
- How do different types of firms engage in global value chains?

Future research will lead to refinements in the measurement of extended SUTs and new insights about the role of MNEs in the U.S. economy. BEA and the U.S. International Trade Commission are currently collaborating to produce more detailed estimates that are disaggregated by firm type using the methodology in this paper. Looking ahead, BEA and the Census Bureau will

5. The MNE data on imports do not provide information on whether the imports are used as intermediate inputs or sold as final demand in the economy. The assumption made that total imports are consumed as intermediate goods is most plausible for manufacturing in which imports make up 25 percent of intermediate inputs for foreign-owned MNEs, compared with 18 percent for domestic-owned MNEs and 1 percent for non-MNEs.

Chart 2. Imports and Exports of Goods as a Share of Output by Type of Firm, 2011

undertake research at the Census Bureau Center for Economic Studies with the eventual goal of developing official extended SUTs and other statistics that more fully measure the impact of global value chains on the U.S. economy.
